Program outline

Ancillary Services: Research Results From Wind Power Plants

- *Characteristics and requirements* for ancillary service provision to European power systems now and in the future
- Technical capabilities required by wind power plants in order to provide ancillary services - a focus on state-of-the-art industry and R&D (simulation based) perspectives
- What are the economic incentives and barriers to providing ancillary services?
- What are the *next steps* for researchers, developers, system operators and turbine manufacturers to allow further penetration of wind into European grids?

Definitions of ancillary services

- CIGRÉ report overview of International Practices
 - definitions for ancillary services can differ significantly based on who is using the terms. While some definitions emphasize the importance of ancillary services for system security and reliability, others mention the use of ancillary services to support electricity transfers from generation to load and to maintain power quality
- Some TSOs are including more specific types of ancillary services than others because
 - differences in the definitions (above)
 - some of the required properties of the generation plants are embedded in conventional power plants using directly grid connected synchronous generators.
 - new ancillary service products seem to pop up in power systems with large scale penetration of renewables.

Requirements for – and types of – ancillary services

- Active power reserves (using ENTSO-E glossary)
 - Frequency containment reserves (FCR)
 - Frequency restoration reserves (FRR)
 - Replacement reserves (RR)
- Properties required to *maintain* power system *stability* today (Energinet.dk terminology)
 - Short-circuit power
 - Continuous voltage control
 - Voltage support during faults
 - Inertia
- Possible new ancillary service products (research references)
 - Fast frequency response (and inertia support)
 - Synchronising power
 - Power oscillation damping
 - Black-start capability

Background

PSO project EaseWind

Enhanced Ancillary Services from Wind Power Plants

Partners: Vestas Technology R&D

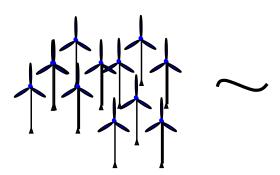

DTU Wind Energy

DTU Compute

AAU IET

Objective

to develop technical solutions for enabling wind power to have similar power plant characteristics as conventional generation units.

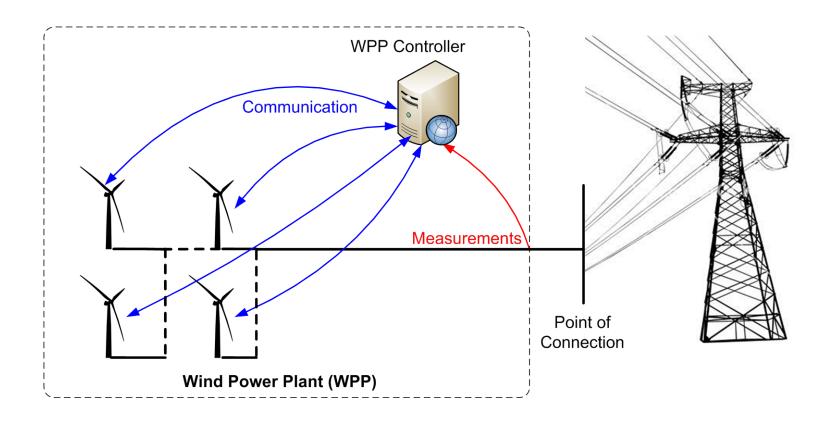

Wind power replacing conventional power plants!

Ancillary services from wind power plants

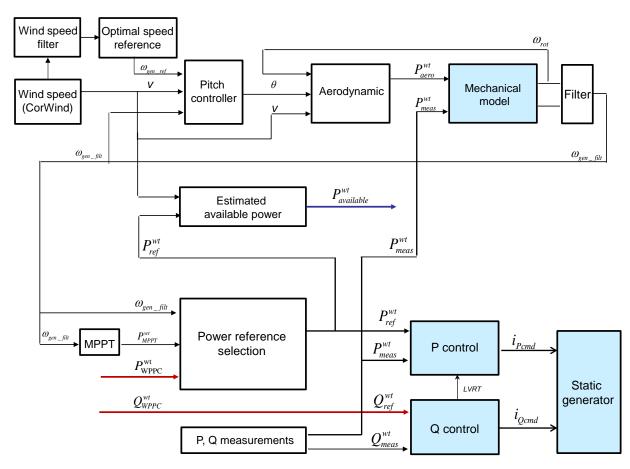

The ancillary services from wind power plants are *supported by communication and control* at the power plant level.

Simple generic wind power plant model

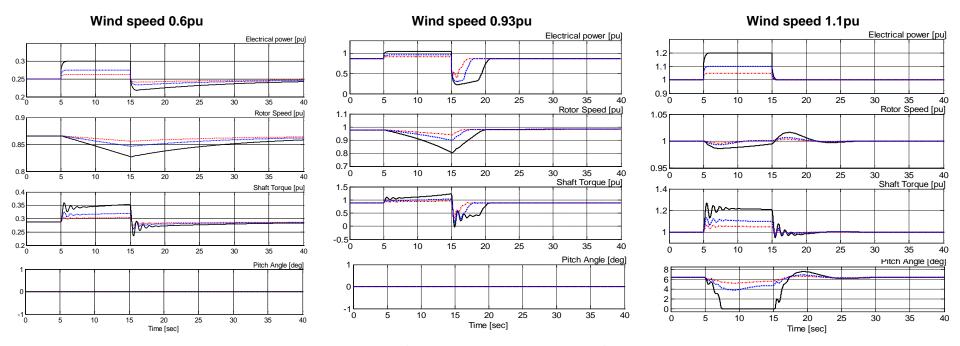

- follows the basic structure of the IEC standard Type IV wind turbine model
- includes additional adjustments to reflect the dynamics relevant for active power and grid frequency control capabilities.

Short-term overproduction capability

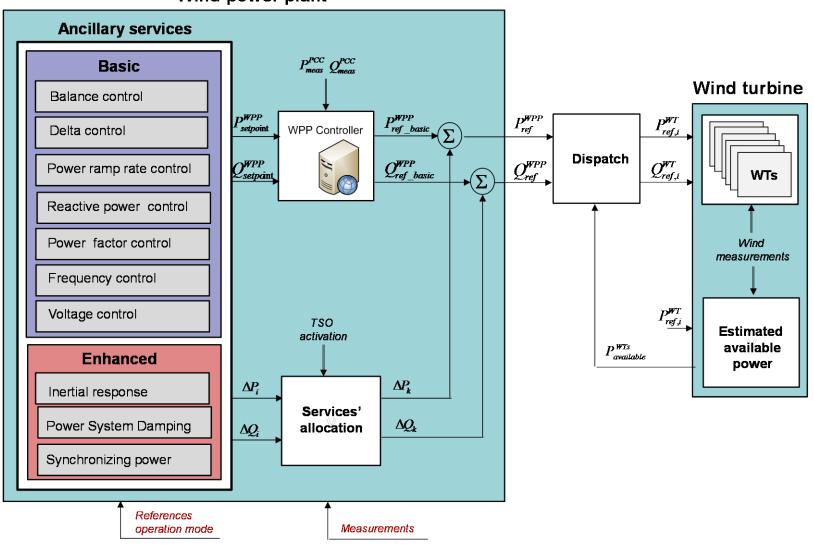

- Below rated wind speed, the overproduction is followed by recovery period
- The higher the wind speed, the shorter the recovery period
- The higher the overproduction power:
 - the longer the recovery period and the larger the power underproduction -> frequency stability might be affected
 - the higher the shaft torque -> high mechanical stress of the turbine
- No power recovery above rated wind speed

WP 3 – Communication and control in clusters of wind power plants connected to offshore HVDC grids

PhD student: Lorenzo Zeni

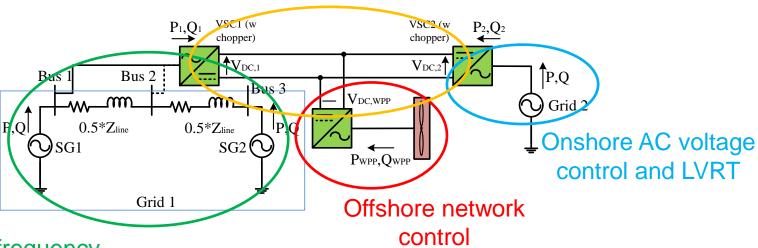

Results – status

L. Zeni et.al. From paper in Cigré session 2014

Investigation on system services provision

DC voltage control

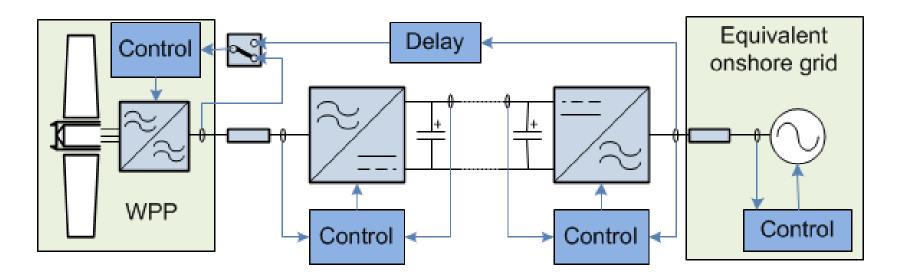

Onshore frequency control and power oscillation damping

Important results obtained and lines for future work were drawn.

Frequency support through HVDC P2P example

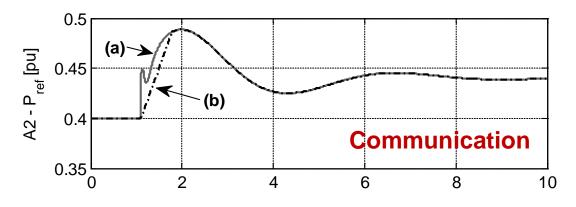

Two strategies are compared:

- 1. Communication-based control (with communication delay)
- 2. Coordinated control mirroring the frequency in DC voltage

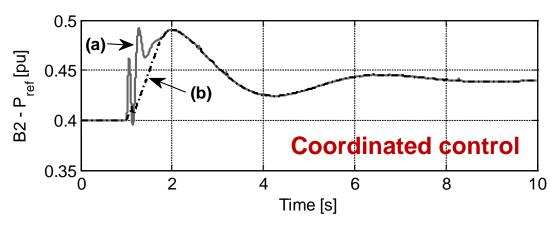

On the inertial contribution

Power reference to WPP

- (a) From controller
- (b) Ramp-limited

The initial power support is heavily limited by the ramp limiter (0.1 pu/s):

relaxation of this figure?

Conclusions

- Onshore frequency variations can be mirrored offshore
- Hence, WPPs can provide frequency control through HVDC with communication-less scheme
- In a P2P connection, communication-based and coordinated solutions are equivalent, as far as frequency control and inertial response are concerned
- Fast control actions are inhibited by ramp rate limiters in the WPP

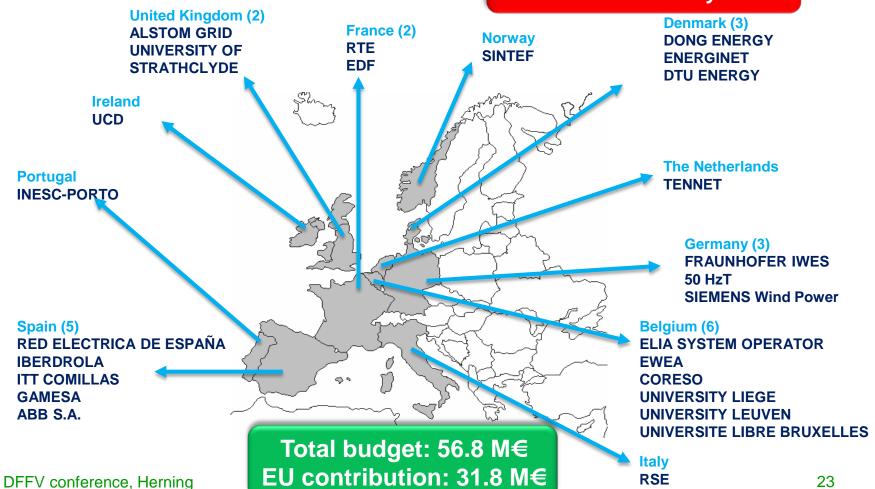

Consortium and budget

Nordic	4,924	14,669
GB	13,711	33,601
Ireland	1,419	3,219

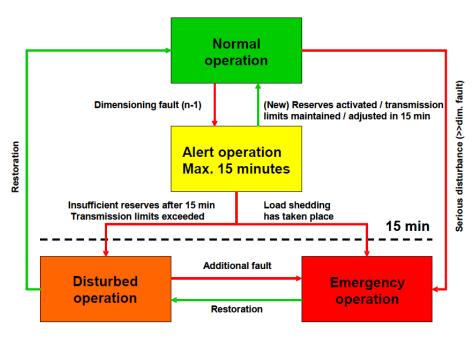

DFFV conference, Herning

Large scale challenge: Adequacy of primary reserves

- There must be sufficient primary reserves in the power system synchronous area to replace lost production corresponding to dimensioning fault
- This brings power system from normal state to alert state
- Frequency restoration (secondary / tertiary) reserves will return system to normal state in 15 minutes
- Larger faults (loss of generation) may bring system into disturbed (or emergency) state
- Therefore, maximum 15 minute wind power forecast errors are essential to esure adequacy of primary reserves

Synchronous Area	Dimensioning faultt		
	MW		
Continental	3,000		
Nordic	1,200		
GB	1,800		
Ireland	500		

Nordic grid code 2007

Upscaling results and conclusion

- Result for 2020 indicates that there is sufficient primary reserves with current dimensioning fault to cover offshore wind power variability in the four main European synchronous areas
- Result for 2030 indicates that there is not sufficient primary reserves with current dimensioning fault to cover offshore wind power variability in Continental and GB synchronous areas
- Current requirements for primary reserves should be revised by 2030 to maintain secure operation

Synchronous Area	HWSD	HWEP	Dimensioning faultt

Simulation of balancing (Simba)

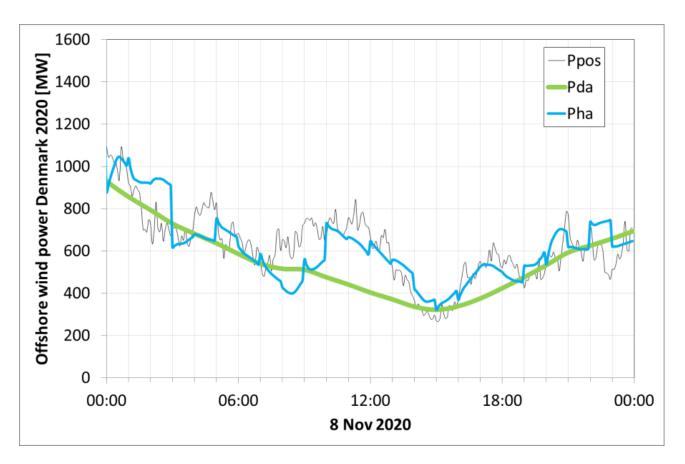

Simulation of Balancing (Simba)

- Simba idea
 - Simulation of intra hour balancing as supplement to day ahead
 - Uses inputs from "day-ahead market model"
 - Main imbalance included today is from wind
- Applications of Simba
 - Planning of investment
 - Assessment of new market designs (e.g. towards real time)
 - Assessment of cost / value of reserves
 - Assessment of needs for reserve capacities
 - Economic optimisation of system services
 - Assessment of flexible demand support to system balancing

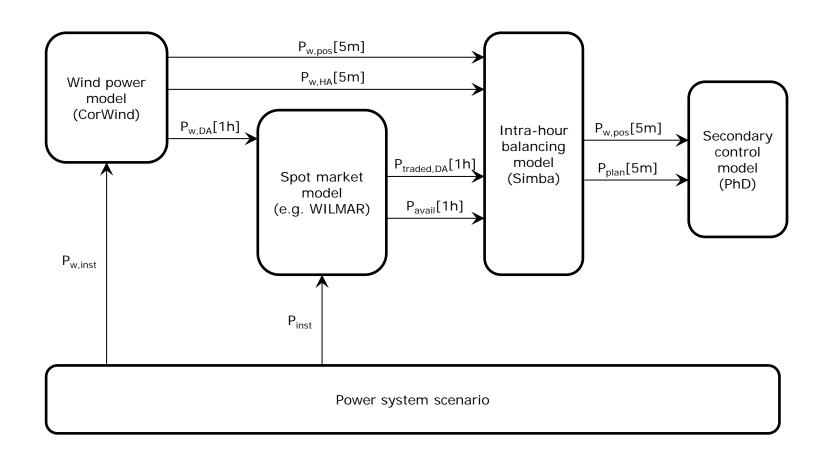

CorWind Simulation of wind power fluctuations and forecast errors

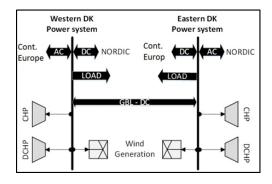

Modelling chain

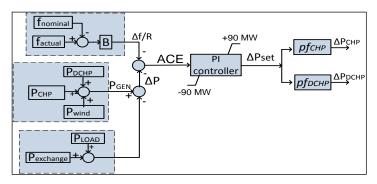

DTU

Automatic Generation Control in a power system with high wind power penetration - Danish case study

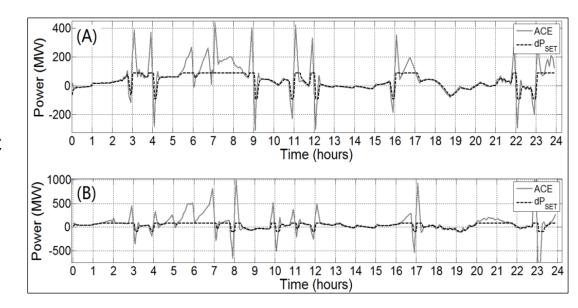

Model overview

Result: simulated AGC performance

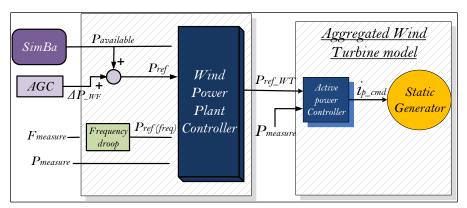

AGC model

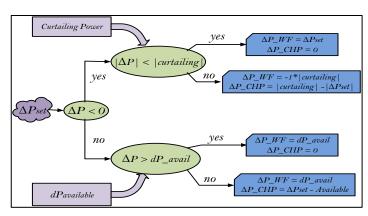

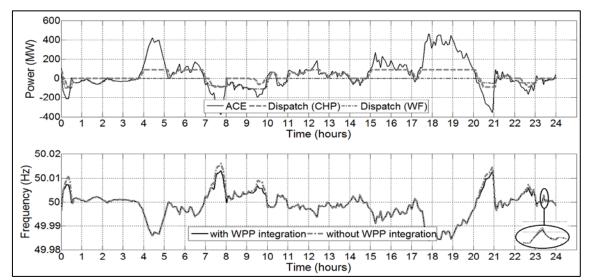

Wind Power integration into the Automatic Generation Control of power systems

Aggregated WPP model

Secondary (AGC) dispatch with wind

Summary and reflections on technical capabilities

- WPPs can provide basic ancillary services and replace conventional power plants
- Also possible to provide enhanced ancillary services emulating synchronous generators (inertia-like response, power oscillation damping and synchronizing power)
 - ... but is this the optimal solution in future systems?
- Ancillary services can also be provided from HVDC connected WPPs

Economic incentives and barriers

- Incentives:
 - Technical requirements for grid connection!
 - Higher prices for reserves than for power (e.g. low and even negative power prices)
 - Co-generation with other production technologies (ramp support)
 - Enables higher wind power penetration
- Barriers:
 - Symmetric (up/down) requirement (Spain TWENTIES)
 - Downwards reserves from WPPs is feasible with high penetration
 - ... loads are more feasible as upwards reserves
 - Length (= prediction horizon) of reserve products
 - Development costs for new products
 - Additional hardware costs
 - Verification needs for new products costly certifications

/

TPWind Technology Platform New strategic research agenda (SRA) / Market deployment strategy 2014

- Issues very similar to REserviceS
 - Frequency support
 - Voltage support
 - System restoration support
- Research priorities
 - Further development of enhanced wind power capabilities from wind turbine level up to cluster level, including the related design tools and models;
 - Testing and verification of frequency and voltage capabilities, and methods of proving compliance of new solutions for advanced capabilities with Grid Codes and standards;
 - Harmonisation, standardisation and interoperability of methods and technologies for delivering ancillary services with wind power.

Next steps to allow further penetration of wind into European grids?

- Researchers
 - Propose strategies for ancillary services to ensure system strategy from wind and other sources
 - Special focus on power system security with increasing levels of non-synchronous generation
 - Not necessarily emulation of synchronous generators!!
 - Develop and implement new controls in simulation tools
 - Simulation based validation of ancillary services from wind
 - Develop tools to assess the value of new ancillary services
- Developers / owners
 - Assess the value of new ancillary services
- System operators
 - Propose and verify new strategies to ensure system security
- Turbine manufacturers
 - Develop and implement new ancillary service capabilities in full WPP scale
