Agenda

• A brief introduction to McStas, Monte Carlo & raytracing

• Highlighted new features in McStas 2.1
  • McStas-MCNP for background estimates
  • McStas-Mantid event processing
  • Speedup in Single_crystal.comp
McStas Introduction

• Flexible, general simulation utility for neutron scattering experiments.

• Original design for Monte carlo Simulation of triple axis spectrometers

• Developed at DTU Physics, ILL, PSI, Uni CPH, ESS

• V. 1.0 by K Nielsen & K Lefmann (1998) RISØ

• Currently 2.5+1 people full time plus students

What is McStas used for?

- Instrumentation
- Virtual experiments
- Data analysis
- Teaching

(KU, DTU)
Reliability - cross comparisons

• Much effort has gone into this
• Here: simulations vs. exp. at powder diffract. DMC, PSI
• The bottom line is
• McStas agrees very well with other packages (NISP, Vitess, IDEAS, RESTRAX, ...)
• Experimental line shapes are within 5%
• Absolute intensities are within 10%
• Common understanding: McStas and similar codes are reliable

New developments in McStas
Neutron ray/package:

- Weight (p): # neutrons (left) in the package
- Coordinates (x,y,z)
- Velocity (v_x,v_y,v_z)
- Spin (s_x,s_y,s_z)

Time (t)

Components: Here the neutron physics happen, neutron weight adjusted according to scattering probabilities etc.

Instrument: positioning + transformation between sequential component coordinate systems, e.g. neutron source, crystal, detector.

McStas

Monochromatic neutron source

Detector

Local, internal coordinate system!

In Bragg scattering condition
Elements of Monte-Carlo raytracing

- Instrument Monte Carlo methods implement coherent scattering effects
- Uses deterministic propagation where this can be done
- Uses Monte Carlo sampling of “complicated” distributions and stochastic processes and multiple outcomes with known probabilities are involved
  - i.e. inside scattering matter
- Uses the particle-wave duality of the neutron to switch back and forward between deterministic ray tracing and Monte Carlo approach

Result: A realistic and efficient transport of neutrons in the thermal and cold range
**McStas overview**

- Portable code (Unix/Linux/Mac/Windoze)
- Ran on everything from iPhone to 1000+ node cluster!

- 'Component' files (~150) inserted from library
  - Sources
  - Optics
  - Samples
  - Monitors
  - If needed, write your own comps

- DSL + ISO-C code gen.

*New developments in McStas*
Neutron optics and other instrument components

New developments in McStas
Writing new comps or understanding existing is not that complex...

- Check our long list of components and look inside... Most of them are quite simple and short... Statistics:

Number of lines of code per component - 165 comps in total
Example suite: 123 instruments
New developments in McStas

1. Work on McStas-MCNPX interfaces

Collaboration
DTU Nutech
DTU Fysik
ESS

\[ \mathbf{n}_t = (r_t, v_t, t_t, s_t, p_i - p_r) \]
\[ \mathbf{n}_r = (r_r, v_r, t_r, s_r, p_r) \]

\[ \mathbf{n}_i = (r_i, v_i, t_i, s_i, p_i) \]
McStas-MCNPX interfaces for beam losses

Use: Check the Scatter_logger.comp in the McStas distribution

Future: Geant4, PHITS?

Collaboration

DTU Nutech
DTU Fysik
ESS

Journal of Physics: Conference Series Volume 528 conference 1
McStas-Mantid event processing facilitated by:

- Special labels in component list
- Special Monitor_nD parameters
- IDF autogenerated by “mcdisplay” run
- NeXus output and LoadMcStas Mantid algorithm
McStas-Mantid event processing facilitated by:

- Special labels in component list
- Special Monitor_nD parameters
- IDF autogenerated by “mcdisplay” run
- NeXus output and LoadMcStas Mantid algorithm

Use: Check out templateSANS_Mantid from the McStas distribution - fully functional reduction
Events shown on the full instrument

- The event data from McStas should look something like this in “full 3D” - you may have to move/zoom a bit about
Events shown on the full instrument

- The event data from McStas should look something like this in "full 3D" - you may have to move/zoom a bit about

Use: Check out ILL_H16_IN5_Mantid from the McStas distribution - (not yet fully functional reduction)
Problem: McStas Single_crystal.comp “slow” for large unit cell diffraction studies

• Example: Rubredoxin

1 timebin, 1000 x,y-bins

Rubredoxin

Images created from simulated datafile produced August 20th 2012 using 25 nodes on the DMSC cluster.

Neutron count: 1e12

Simulation time: $\sim 10 + \sim 20$ hr = $\sim 30$ hrs total

• Reflection list $\sim 124$ K reflections (still “small” in the PX world!!)

Neutroncount: 1e12
No gravitation
Xtal size: 0.5 mm
Xtal mosaicity: 12°
Detector: 50 x 50 cm flat
Detector-to-sample distance: 20 cm
Guide length: 131 m
Guide dimensions: 9.5 cm
$\lambda_{min} = 1.3$ Å
$\lambda_{max} = 3.5$ Å
Time span: 51.39 to 143.4 ms
Divergence = 0.2 degress
Algorithm improvement: **Use incoming neutrons more efficiently** - scatter each one on all possible reflections

- **Red**: Original algorithm, one incoming neutron used only once
- **Blue**: Improved algorithm, each incoming neutron scattered (via SPLIT keyword) all possible times
- Component makes **estimate on average number of “active” diffraction spots** - in the case Rubredoxin this is around **50**!
Sim data speak for themselves - 1e9 rays

Old comp

New comp

Rubredoxin 124K reflections

Predeuterated pyrophosphatase 1.7M reflections

~ Factor 50 more efficient

~ Factor 500 more efficient
Sim data speak for themselves - 1e9 rays

Old comp

New comp

Use: Check out template_NMX from the McStas distribution

Similar optimisation of the PowderN component
People

• The success of the project is also about the people:

• Present McStas team members
  - K Lefmann
  - E Farhi
  - P Willendrup
  - E Knudsen
  - U Filges
  - T R Nielsen

• Past McStas team members
  - K Nielsen
  - PO Åstrand
  - K Lieutenant
  - P Christiansen
  - J Brinch
