Agenda

• A brief introduction to McStas, Monte Carlo & raytracing

• Highlighted new features in McStas 2.1
  • McStas-MCNP for background estimates
  • McStas-Mantid event processing
  • Speedup in Single_crystal.comp
**McStas Introduction**

• Flexible, general simulation utility for neutron scattering experiments.

• Original design for Monte carlo Simulation of triple axis spectrometers

• Developed at DTU Physics, ILL, PSI, Uni CPH, ESS

• V. 1.0 by K Nielsen & K Lefmann (1998) RISØ

• Currently 2.5+1 people full time plus students

McStas

New developments in McStas
McStas Introduction

World leading in neutron Monte Carlo

New developments in McStas
What is McStas used for?

- Instrumentation
- Virtual experiments
- Data analysis
- Teaching

(KU, DTU)
Reliability - cross comparisons

- Much effort has gone into this
- Here: simulations vs. exp. at powder diffract. DMC, PSI
- The bottom line is
- McStas agrees very well with other packages (NISP, Vitess, IDEAS, RESTRAX, ...)
- Experimental line shapes are within 5%
- Absolute intensities are within 10%
- Common understanding: McStas and similar codes are reliable

E. Farhi, P. Willendrup et al., in preparation

Neutron ray/package:

Weight (p): # neutrons (left) in the package
Coordinates (x, y, z)
Velocity (v_x, v_y, v_z)
Spin (s_x, s_y, s_z)

Time (t)

Components: Here the neutron physics happen, neutron weight adjusted according to scattering probabilities etc.

Instrument: positioning + transformation between sequential component coordinate systems, e.g. neutron source, crystal, detector.
Elements of Monte-Carlo raytracing

- Instrument Monte Carlo methods implement coherent scattering effects
- Uses deterministic propagation where this can be done
- Uses Monte Carlo sampling of “complicated” distributions and stochastic processes and multiple outcomes with known probabilities are involved
  - I.e. inside scattering matter
- Uses the particle-wave duality of the neutron to switch back and forward between deterministic ray tracing and Monte Carlo approach

• Result: A realistic and efficient transport of neutrons in the thermal and cold range
McStas overview

- Portable code (Unix/Linux/Mac/Windoze)
  - Ran on everything from iPhone to 1000+ node cluster!

- 'Component' files (~150) inserted from library
  - Sources
  - Optics
  - Samples
  - Monitors
  - If needed, write your own comps

- DSL + ISO-C code gen.
Neutron optics and other instrument components

New developments in McStas
Writing new comps or understanding existing is not that complex...

- Check our long list of components and look inside... Most of them are quite simple and short... Statistics:

Number of lines of code per component - 165 comps in total
Example suite: 123 instruments
McStas-MCNPX interfaces for beam losses

\[ n_t = (r_t, v_t, t_t, s_t, p_i - p_r) \]

\[ n_r = (r_r, v_r, t_r, s_r, p_r) \]

Dose (Sv) vs. Length along y [m]

Collaboration
DTU Nutech
DTU Fysik
ESS
New developments in McStas

- Work on McStas-MCNPX interfaces

Use: Check the Scatter_logger.comp in the McStas distribution

Future:
- Geant4
- PHITS?

Journal of Physics: Conference Series Volume 528 conference 1
McStas-Mantid event processing facilitated by:

- Special labels in component list
- Special Monitor_nD parameters
- IDF autogenerated by “mcdisplay” run
- NeXus output and LoadMcStas Mantid algorithm
McStas-Mantid event processing facilitated by:
- Special labels in component list
- Special Monitor_nD parameters
- IDF autogenerated by “mcdisplay” run
- NeXus output and LoadMcStas Mantid algorithm

Use: Check out templateSANS_Mantid from the McStas distribution
- fully functional reduction
Events shown on the full instrument

- The event data from McStas should look something like this in "full 3D" - you may have to move/zoom a bit about
Events shown on the full instrument

- The event data from McStas should look something like this in “full 3D” - you may have to move/zoom a bit about

Use: Check out ILL_H16_IN5_Mantid from the McStas distribution - (not yet fully functional reduction)
Problem: McStas Single_crystal.comp “slow” for large unit cell diffraction studies

- Example: Rubredoxin

Rubredoxin

Images created from simulated datafile produced August 20th 2012 using 25 nodes on the DMSC cluster.

Neutron count: 1e12
Simulation time: ∼10 + ∼20 hr = ∼30 hrs total

- Reflection list ∼ 124 K reflections (still “small” in the PX world!!)
Algorithm improvement: **Use incoming neutrons more efficiently** - scatter each one on all possible reflections

- **Red**: Original algorithm, one incoming neutron used only once
- **Blue**: Improved algorithm, each incoming neutron scattered (via SPLIT keyword) all possible times

- Component makes **estimate on average number of “active” diffraction spots** - in the case Rubredoxin this is around **50**!
Sim data speak for themselves - $1e9$ rays

**Old comp**

Rubedoxin

$124K$ reflections

Predeuterated pyrophosphatase

$1.7M$ reflections

**New comp**

~ Factor 50 more efficient

~ Factor 500 more efficient
Sim data speak for themselves - 1e9 rays

Old comp

[LOG] det 1e9_single/psd.dat
X0=-7.56618; dX=97.4494; Y0=0.503148; dY=41.0417;
l=212.112 Err=1.14736 N=42254

Rubodoxin 124K reflections

New comp

[LOG] det 1e9_parallel/psd.dat
X0=-6.35127; dX=97.5669; Y0=0.343201; dY=41.1348;
l=210.788 Err=0.162219 N=2.09642e+06

~ Factor 50 more efficient

Use: Check out template_NMX from the McStas distribution

Similar optimisation of the PowderN component

~ Factor 500 more efficient
The success of the project is also about the people:
