# Centre for IT-Intelligent Energy Systems for Cities

Årsmøde CLEAN  
22. Maj 2015

(AI)Fred Heller  
Vice Centerleder CITIES  
Lektor DTU Byg  
[alfh@byg.dtu.dk](mailto:alfh@byg.dtu.dk)

# Smart Cities – Hvorfor det?

- Byer's infrastrukturer, IT, organisation bliver mere og mere kompleks.
- Der søges efter en rationale til samling.
- *Smart Cities er rationalet til at samle "alt" i byen  
– organisatorisk som teknisk  
... hvor Big Data er et værktøj af mange*
- Det giver en unikt mulighed for forretning og innovation.

(AI)fred Heller

# Smart Cities er seriøst forretning

## **CITIES**

- 71 mio
- 44 mio i tilskud DSF
- 40 partner
- 2014-2019 (2020!!!)
- Forskning
- 11 PhD
- 5 PostDocs

## **EnergyLab Nordhavn**

- 129 mio
- 79 mio i tilskud EUDP
- 8 partner
- 2014-2019
- Udvikling og demonstration
- 9 PhD
- 4 PostDocs

Projekterne vokser og bliver flere

International: IEA, EERA, EU, partner fra Korea, USA, ... hele verden

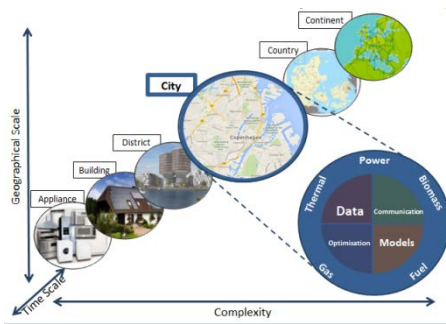

# Den grundlæggende ide (bag CITIES)

## Overgang i verdens energisystemer

## Dimensioner:

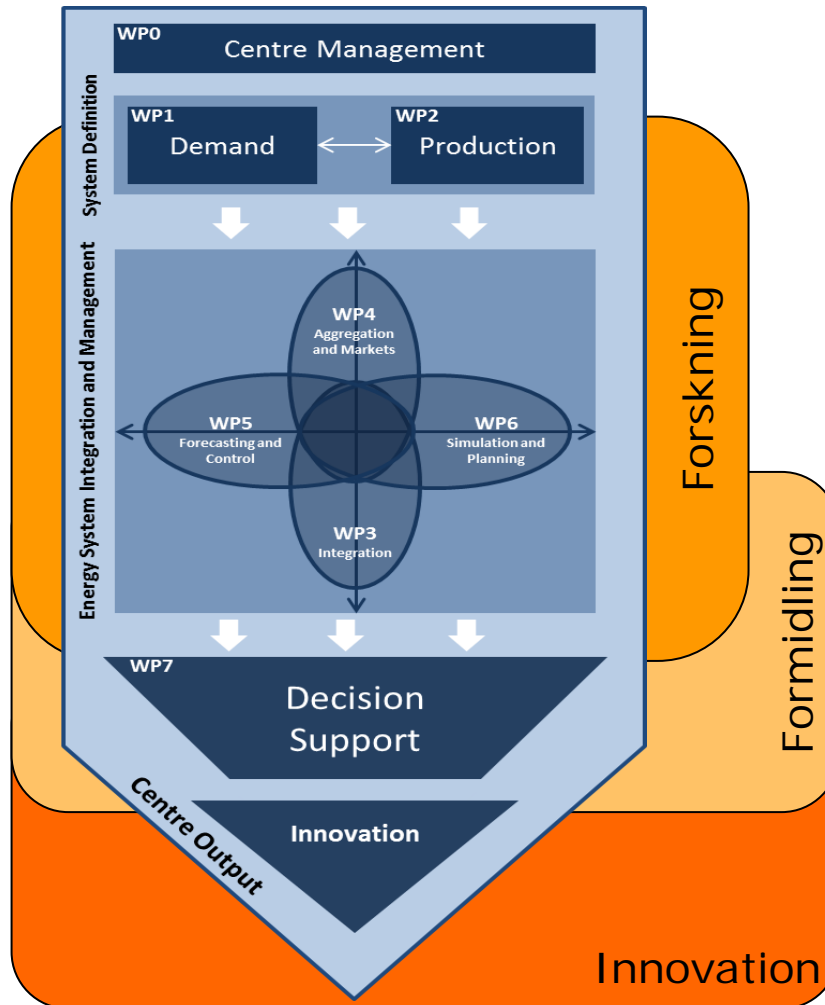

## System: (grundtanke)

Vi ønsker at bygge  
**ÉT MODEL**  
 men  
 mere realistisk er  
 at bygge flere modeller der  
 bygges sammen i  
en simuleringsplatform  
 understøttet af data og en  
**dataplatform**

# Organisering

# Forskningsmetoden /r

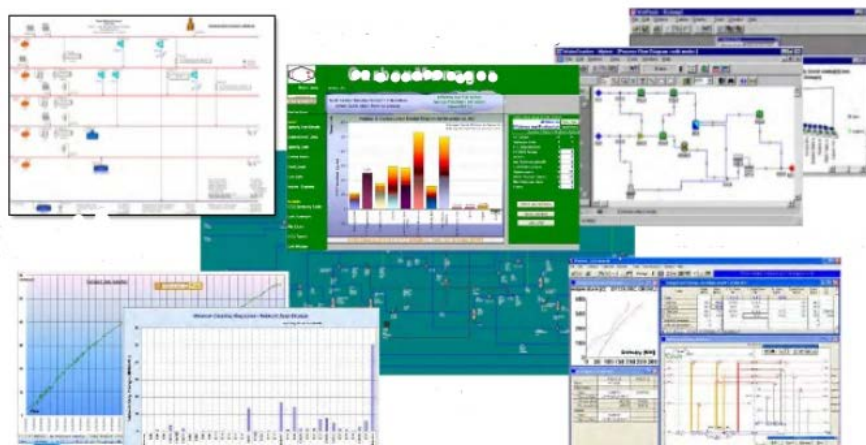

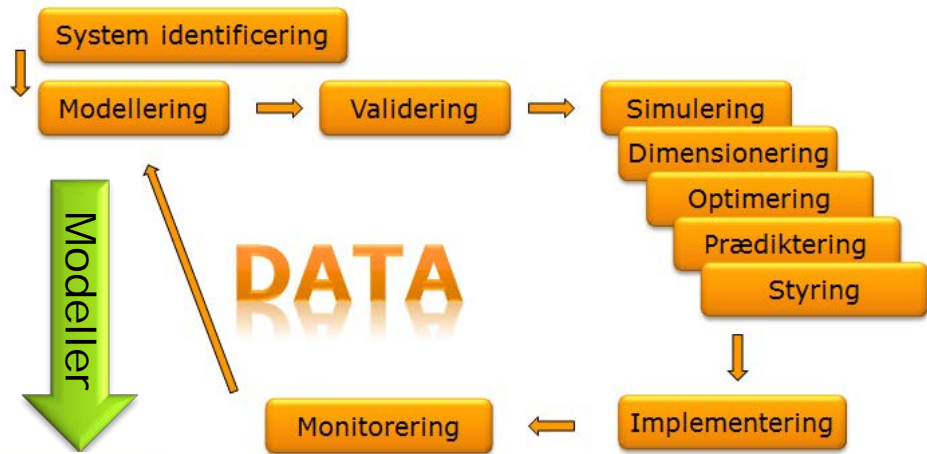

Måling (evidens):

Waspote Platform

Data som fælles råstof:

## Metode - Test Labs

- ESIF (NREL, USA)
- Kubic (Tecnalia, Spain)
- DH facilities in S. Korea
- UCD Ireland
- PowerLab.dk (SYSLAB/Bornholm)
- Grundfos test buildings
- Danfoss test facility for supermarket cooling
- DTU's test houses

## Metode - Living Labs (Byer)

- Modelby: Svendborg
  - Odense
  - Vinge: Frederikssund
  - København
  - Århus
  - Horsens
- og flere associeres løbende...

Fjernvarme  Fyn

AARHUS  
KOMMUNE 

 Horsens Varmeværk

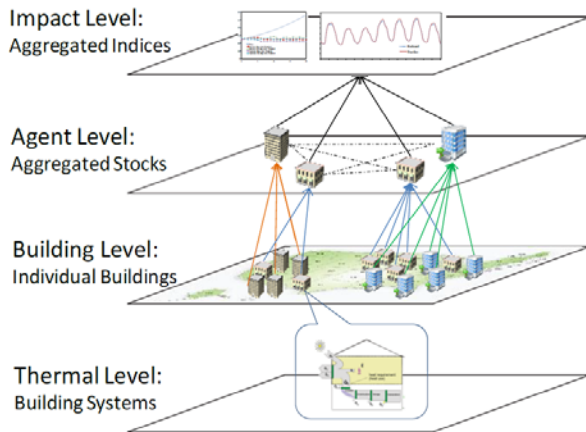

Bright Green Business  
ProjectZero 

FREDERIKSSUND  
KOMMUNE

KØBENHAVNS KOMMUNE

## Modelby Svendborg

aggregering

### Aggregation

One main prerequisite towards the optimization of Smart Cities' energy performance, is the determination of their energy demand. Although significant effort has been placed on the calculation of individual buildings' energy demand, new ways have to be investigated that treat large numbers of buildings as clusters or entities and estimate their energy demand as a whole.

How building energy demand can be determined at aggregated level: streets, neighborhoods or whole cities.

- Numerical methods
  - Simplest calculation of summing all energy demands up
  - Weighting factors
$$E = \sum_{i=1}^N (EUI(i) \cdot WF(i))$$

where  $i$  is the building or building type

  - ✓ Proposed weighting factors: **share of floor area** with respect to the total floor area
- Statistical models → Regression models for short-term heat load forecasting
- Urban Simulation Tools → Parallel processing of individual building energy simulations, while considering the neighboring buildings in terms of shading, wind blockage etc.  
E.g. *Umi, CitySim*
- Archetype modeling
  - building typologies and databases
  - creation of representative example buildings for every category/type and use these for aggregating energy demands instead of using thousands of buildings in cities.

❖ **Building typologies** serve the need for a wider and more macroscopic assessment of building stocks. The current necessity to evaluate the behavior of several building types in order to determine whether and to what extend they can contribute to more flexible energy demand.

	Primarily	Secondarily
Building typologies rely on parameters such as:	<ul style="list-style-type: none"> <li>• Energy performance</li> <li>• Use of building</li> <li>• Age of construction</li> </ul>	<ul style="list-style-type: none"> <li>• Existing ventilation and heating/cooling systems</li> <li>• Existing Energy systems</li> <li>• Renovation and potential energy retrofitting</li> </ul>

Lille suk:

1 års arbejde for at etablere opsamling af data fra 140 bygninger

(el, fjernvarme, gas)

## Case – Dynamiske Fjernvarmepriser

Erfaringer opsamles

Dynamiske modeller opbygges og simuleringer bruges for at skabe scenarier

Kontrakter defineres og forsøges anvendt

## Case – Flexibilitet i væksthuse

Væksthuse

- særpræget hygrotermiske forhold
- mulighed for at køre temperaturen op og ned
- mulighed for ekstra termiske buffere

# Case – Styring af Heat Pumps

## Heat Pumps Extract Heat from the Ground

- 1) Ground warms cold water flowing through horizontal or vertical loops.
- 2) Heat pump extracts heat from the water and compresses the gas in order to make it hotter.
- 3) Heat is stored and is available for heating and hot water production.

Greybox modeller til prædiktering af varmebehov ud fra vejret og energipriser

Innovation: MPC styringer for bygninger, fjernvarme og meget andet
