Department of Chemical and Biochemical Engineering
Background of dielectric elastomer (DE)

DE - changes size/shape (presence of electrical field)
- compliant capacitor (electrostatic stress > elastic stress)

DEs: silicones, acrylates, polyurethanes and thermoplastic elastomer copolymer.

Actuator
Herbert Shea – EPFL Switzerland

Generator
Roy Kornbluh et al - SRI International, USA

Sensor
Ben O’Brien – University of Auckland
DE as an actuator

Morphology in block copolymers

Multiblock copolymer

\((AB)_n\)

Morphology - COMPLEX

Common morphologies of block copolymers

Spheres  Cylinders  Gyroids  Lamellar

Increasing volume fraction \((f_A)\)

Domain spacings

PDMS versus PEG

Polydimethylsiloxane (PDMS)

- Low modulus
- Low conductivity
- Low permittivity (net dipole moment, $\mu=0.6 - 0.9$ D)$^4$

Polyethyleneglycol (PEG)

- High Permittivity (a dipole moment, $\mu=3.91$ D)$^5$
- High conductivity
- Not flexible

# Experimental

Sample details for PDMS-PEG multiblock copolymers

Note: $M_n$ of PEG in PDMS-PEG block copolymer is 250 g/mol
The blends and sample preparation

1) Crosslink PDMS-PEG block copolymer (BCP) with 9-functional (9-f) crosslinker
2) Blend the block copolymer with commercial PDMS (MJK) and crosslink with 9-f crosslinker

1) 1 mm film – rheology & permittivity
2) 100 μm film – dielectric breakdown strength
Relative permittivity VS dielectric loss factor (BCP)

Relative permittivity, $\varepsilon'_r$

* $Y = 3G'$

$$F_{OM}(DEA) = \frac{3\varepsilon_r \varepsilon_0 E_{BD}^2}{Y}$$

$F_{OM}$ (DEA) of Elastosil RT625 ($1.86 \times 10^{-24}$)
Conclusion

• Incorporating conducting PDMS-PEG block copolymer with non-conducting PDMS elastomer:
  • Improve relative permittivity up to 60% with low loss permittivity and non-conducting.
  • Maintain low modulus (obtain soft elastomer).
  • Based on FOM, the actuation improves by 17-fold compared to reference material (Elastosil RT625).
