EGU2019-6614

NASA’s Juno mission entered into polar orbit about Jupiter on July 4th, 2016. Since then 17 science orbits have been completed, systematically mapping the 3D magnetosphere of Jupiter for the first time. Located on the tip one of Juno’s three solar arrays, the Magnetic Field Experiment carries an absolute altitude reference sensor, the fully autonomous “micro Advances Stellar Compass” (µASC) designed and built at the Technical University of Denmark.

**micro Advanced Stellar Compass µASC**
- Designed and produced by the Measurement and Instrumentation Systems (DTU Space)
- One of the most successful star tracker worldwide
- Autonomously calculates altitude based on all bright stars in the CHUs Field of View
- Absolute accuracy of < 1 arc second
- Operating on many satellite missions without a single hardware or functional failure

µASCs’ Advanced Observational Capabilities:
- Optical imaging of solar system bodies
- Autonomous detection and tracking of objects
- Characterization of the hypervelocity dust impacts on the spacecraft.
- Detecting high energy particles (>15MeV electrons and 100MeV protons)

The µASC provides continuous record of the energetic particle environment traversed by Juno, and its interaction with the moons of Jupiter. We give an overview of the highly energetic particle population, the interaction with the Jovian moons, and the footprints left in the Jovian atmosphere by the Galilean satellites.

**Calibration**
- The µASC response to the high energy irradiation is fully calibrated using 1-2 MeV electron and 30-200 MeV proton irradiation with varied incidence angle, flux, dose rate, temperature, TID, and DDD doses.
- CHU shielding stops all e <20 MeV
- Calibrating images acquired during irradiation with high flux of electrons (left) and heavies (right).

**Observations**
- The wiggle plot below shows Juno’s position in magnetic coordinates (Rho, Z) in [R_j]. In the trace of the orbit, the flux measured by the µASC is displayed with a color scale. The major Jovian moons’ radial distance have been also added in the plot in addition to the model of the magnetodisc.
- Juno’s crossing of the magnetic field lines which intersect the Jovian moon orbits is shown. These crossings are correlated with observations of the µASC particle counter.

**Jupiter’s particle environment**
- Model of the Jupiter’s high energy radiation environment
- Better constrains on the Jupiter’s current sheet
- Magnetic footprint of the Jupiter’s inner planet
