Abstract

Focus on sustainable processes and renewable raw materials, combined with rapid advancements in technology developments across scales, makes bio-based production processes a subject of great interest to both industry and academia. Despite this increasing prominence of bio-based production processes, there is a lack of a single course that can provide a thorough overview of the state-of-the-art industrial scale bio-based production, to early stage practitioners and researchers such as post-graduate students. BIOPRO World Talent Campus (WTC), initiated in the year 2013, was specifically designed and developed to address this shortcoming, and has thus far trained more than 120 post-graduate students from related yet diverse academic backgrounds from all across the globe. This manuscript describes the general and technical organisation of BIOPRO WTC and the unique academic and industrial collaboration that exists in Denmark which makes WTC a reality. A special focus is also placed on discussing a 48 hour industrial challenge that is set by leading Danish bio-based production companies and its impact on young post-graduate students, who get hands on experience in dealing with “real world” problems. Results from student surveys carried out during the five years of WTC are reported and discussed to understand the impact of the course. A future perspective is also presented with the focus on the possibility of employing emerging technologies to extend the outreach of the program.

36 1 Introduction

37 Currently, there is a significant body of work as well as continuing research and development efforts within
38 both academia and industry that are directed towards improving the process understanding of bio-based
39 production. Collectively, these works are multi-dimensional across scales, multi-disciplinary and multi-
40 sectoral in nature. For example, the development of accurate mathematical models for biogas production
41 processes from the waste of bio-based production processes requires both laboratory and industrial scale
42 information [1]. This type of work requires a collaborative academic and industrial effort which pools
43 together knowledge, expertise and equipment. The BIOPRO strategic research centre was established to
44 promote the collaboration, where large scale industrial partners work together with start-ups and universities
45 in developing innovative industrially applicable solutions for improving bio-based production processes [2].

46 Starting from a set of renewable raw materials, the production of valuable final and intermediate products
47 through chemical reactions and/or microbial fermentation in large scale production processes has been an
48 area of interest to both academia and industry in the past decades [3,4]. Denmark has historically been a front
49 runner in realising this trend, where companies have been employing bio-based production processes for
50 production of bio-pharmaceuticals, food ingredients, biofuels as well as industrial enzymes [2]. However,
51 despite a rapid growth, deep fundamental understanding of these types of processes is not as well established
52 compared to many traditional chemical processes such as industrial chemical production.

53 From an educational point of view, covering the topic of industrial scale bio-based production processes can
54 be complicated. Firstly, industrial scale bio-based production requires an individual or a project team to have
55 multi-disciplinary knowledge encompassing the areas of chemical engineering [4], biochemical engineering,
56 systems biology, process modelling [1], and process monitoring and control [5], as all of these areas are
57 relevant and hot topics for ongoing research. As a result of the above factors, as well as the relatively novel
58 nature of industrial-scale bio-based production processes, there is a lack of graduate-level reading material
59 and courses that provide a good and thorough overview of the opportunities and challenges of bio-based
60 production at an industrial scale. Indeed, of the eleven courses at the department of chemical and
61 biochemical engineering at the Technical university of Denmark (DTU), only three are related to bio-based

62 production. Only one of these courses focusses on biological processes (bio-refineries), while the other two
63 focus on aspects and innovation of different chemical and biochemical processes and are based on literature
64 research. Multi-disciplinary areas have been an area of active interest in chemical engineering education. For
65 example, a multi-disciplinary lab experiment for coke combustion in a fluidized bed has been designed to
66 teach graduate students mass transport and reaction concepts [6]. Meanwhile, soft skills such as
67 employability [7] or team work [8] as well as more technical concepts such as process safety [9] have also
68 been of interest to educators in the area of chemical engineering.

69 From an educational perspective there is an urgent need for development of courses and/tools that can
70 impart students with relevant applied knowledge as well as transferrable skills to adapt and excel in a rapidly
71 evolving multi-disciplinary, inter-sectoral area of industrial biotechnology manufacturing

72 BIOPRO World Talent Campus, an intensive one week program, was developed to address these needs ,
73 with the following objectives 1) impart cutting edge, industrially relevant knowledge about industrial scale
74 bio-based production processes; 2) build relevant soft skills of a select group of post-graduate level students
75 from all over the world; and, 3) facilitate working in a multi-cultural and multi-disciplinary group.

76 In 2017, BIOPRO strategic research centre organized the 5th edition of WTC in Denmark, with 25 graduate
77 students from universities across the world participating in this week-long course. The following factors
78 make this course distinct from other similar modules in the area of biotechnology-based production:

- 79 • The course is a true collaborative effort between academia and industry with both sectors getting an
80 opportunity to carry out lectures and presentations in an auditorium setting.
- 81 • The lectures are conducted by subject matter experts and cover a large range of relevant topics that
82 are important in gaining a thorough understanding of challenges and opportunities in industrial scale
83 bio-based production processes.
- 84 • The 48 hours industrial challenge is set by the industrial partners, where students work in groups on
85 solutions to a real problem faced by an industrial partner.

- The course balances academic activities with extracurricular activities such as team building as well as showcasing Danish culture and lifestyle.
- It gives students a unique practical exposure to the bio-based industry which is extremely useful for those wishing to work in industry in the future.

As a result of these factors, WTC is currently the only course that allows graduate level students to get a thorough overview of the challenges of the industrial bio-based production industry.

In this manuscript we provide a comprehensive description of a unique multi-disciplinary, multi-dimensional and industrially relevant graduate level course, BIOPRO World Talent Campus (WTC) by reviewing and consolidating the outcomes of the latest WTC (2017) as well as how they are allowing graduate students to get a thorough understanding of challenges and opportunities relevant for industrial bio-based production processes.

2 Campus Organisation Structure

The first edition of WTC was conducted in 2013 and since then, the organisational structure has remained the same. Figure 1 illustrates the overall organisational structure of WTC with the responsibilities of each partner listed. The BIOPRO strategic research centre, Technical University of Denmark (DTU), University of Copenhagen and Novo Nordisk A/S are involved in the major planning, administration and execution aspects of WTC. The industrial partners of the consortium: Novo Nordisk A/S, Chr. Hansen A/S, CP Kelco A/S, Novozymes A/S and Xellia Pharmaceuticals ApS are involved with the teaching modules of WTC, as well as outlining case studies and providing information for the 48 hours industrial process challenge.

Financial and administrative aspects are handled by the Process and Systems Engineering Centre (PROSYS), Department of Chemical and Biochemical Engineering, Technical University of Denmark. Neither the participant nor their universities incur any fees to partake in this course thanks to the generous donation by the Novo Nordisk foundation.

110

111

112

113

Figure 1: Organizational structure of BIOPRO WTC

114

The objective of the WTC is to achieve a good balance of technical content, while allowing participants, company representatives and organisers ample time to network. This allows participants to improve their knowledge base and build long lasting strategic relationships with their peers, the next generation of bio-based technology leaders. The course is conducted over a period of eight days in which the participants are either in lectures or solving industrial problems, as described in Table 1.

119

DAY 1	<ul style="list-style-type: none">WELCOME TO DENMARKINTRODUCTION TO THE BIOPRO WTCSOCIAL ACTIVITIES
--------------	--

DAY 2 - 4	<ul style="list-style-type: none"> • Lectures • Presentations by industrial partners • Team building activities
DAY 5-6	<ul style="list-style-type: none"> • 48 hour industrial process challenge (including company visits)
DAY 7	<ul style="list-style-type: none"> • Presentation of the results of the 48 hour challenge to the industrial partners and invited guests • Gala dinner with industrial partners and collaborators
DAY 8	<ul style="list-style-type: none"> • Visit to the Novo Nordisk Centre for Biosustainability • Tour of Copenhagen • Goodbye dinner

120

121 **3 The participants**

122 The participants for WTC are selected from a wide pool of applicants who are currently enrolled in graduate

123 or post-graduate studies in areas related, to or of vital interest to improving the competitiveness of industrial

124 bio-based production processes. In the past years, WTC has educated post-graduate students from over 20

125 universities. Figure 2 illustrates the universities represented in the 2017 edition.

126

127 Figure 2: Participant map of WTC 2017.

128

129

130

131

132 *3.1 Selection criteria*

133 Due to the generous funding that is provided by the Novo Nordisk foundation, the WTC course is held as a
134 fully sponsored course, where all expenses (including air tickets) are paid for by the WTC for a select group
135 of 25 students. Organisers of WTC look at the following factors when selecting participants:

- 136 • The applicants must be enrolled in post-graduate level studies in one of the key topics defined in the
137 learning objectives (section 4.1)
- 138 • The applicants should demonstrate clear motivation and enthusiasm for participating in the WTC as
139 well as expected learning outcomes.
- 140 • Applicants should identify the key competencies that make them a valuable addition to the WTC
- 141 • The applicants should have a working proficiency in English and the ability to work in a group
142 environment
- 143 • Being enrolled at a key research centre in the area of bio-based production processes will be a bonus.

144 In general BIOPRO receives a relatively large number of applications for each WTC, from which 25
145 successful applicants are selected. The selection process is carried out by a committee consisting of both
146 academic and industrial partners of BIOPRO. Every application received is thoroughly reviewed by the
147 committee, and the applicants are selected based on the collective agreement of the selection Committee..
148 The selection committee also strives to ensure there is a good gender and cultural balance amongst the
149 selected participants.

150

151 **4 Course Content**

152 The WTC technical content/modules are developed and organised by PROSYS at DTU and the Department
153 of Food Science at the University of Copenhagen in consultation with the BIOPRO strategic research centre,
154 as mentioned in Figure 1. The course counts towards 3 ECTS (European Credit Transfer System) for
155 participating post-graduate students.

156

157 *4.1 Learning objectives*

158 The WTC stands out compared to conventional courses as it effectively delivers its objectives and caters to
159 the needs of a diverse set of participants with a variety of cross-disciplinary skills, capabilities as well as
160 areas of interest. To this end, WTC will give participants a general overview of a topic, followed by an
161 introduction to recent advances in the area. In WTC, the following topics are covered:

- 162 I. Introduction to bioprocess manufacturing
- 163 II. Process models and control of bio-based processes
- 164 III. Challenges in large scale bio-based processes
- 165 IV. Bio-based process design

166 At the end of the course the participants are expected to have a proficient understanding of each of these key
167 aspects in the context of industrial bio-based production processes. The participants are also expected to be
168 able to apply this information in solving real world problems and are given the opportunity to apply them
169 during the 48 hour industrial challenge.

170 *4.2 Technical program*

171 The technical program of WTC 2017 is displayed in Table 2. In addition to the five main topics discussed in
172 the learning objectives there are also presentations by the industrial partners, with a focus on current
173 technologies routinely used in industry, as well as development of state of the art methods.

Date	Lectures
Day 1	Introduction to Bioprocess Manufacturing 13.00 -14.00 Introduction to Process Analytical Technology/PAT 14.00 – 16.30 Downstream Processing 16.30 – 17.30 Company 1 Presentation
Day 2	Introduction to Bioprocess Manufacturing 9.00 -10.00 Process Analytical Chemistry/PAC Process Models and Control 10.00 – 11.00 Mechanistic Models, Parameter estimation and Link to Data 16.30 – 18.00 Basic Process Control, Introduction to Predictive Control Large scale Challenges 19.00 – 21.00 System Identification / Soft Sensors for Process Monitoring
Day 3	Statistics for Bioprocesses 9.00 – 11.00 PCA , PLS and Tensor models 11.00 -12.00 Company Presentation 2 14.00 – 15.30 (Multi-variate) Statistical Process Control/(M)SPC 15.30 -17.00 BIOPRO Spin-out Presentations 17.00 – 18.00 Company Presentation 3 19.00 - 20.00 Company presentation 4

175

176 The exceptional aspect of the WTC is that some of the participants themselves would be experts in at least
177 one of these areas, and an open discussion is initiated by the lecturers, where the participants have a free and
178 frank exchange of the challenges and opportunities in their area of expertise. In some instances, participants
179 will engage in further discussion with each other as well as lecturers throughout coffee breaks sometimes
180 well into the evening. These conversations have led to fruitful outcomes and collaborations. It is also
181 important to note that, while these five topics do not cover all aspects of bio-based processes, they reflect the

182 key areas of industrially relevant and applicable research. They Furthermore they provide the participants
183 with an overall picture of challenges and opportunities in bio-based production processes.

184

185

186 **5 The 48 hour Industrial challenge**

187 *5.1 Learning objective*

188 One of the most interesting aspects of the WTC is the 48 hours challenge, where the objective is to give the
189 participants the opportunity to apply both the knowledge gained during the teaching activities as well as prior
190 knowledge to solve real world problems faced by industrial bio-based manufactures. The 48 hour industrial
191 challenge begins with dividing participants into groups, and presenting each group with a real-world
192 industrial problem linked to an industrial partner that needs to be solved within 48 hours. Each group is
193 selected so that there is a balance between participants with different backgrounds and skill sets. This
194 requires the participants to interact with each other and combine their technical expertise to arrive at a single
195 implementable solution.

196 *5.2 How do the groups spend 48 hours?*

197 At the beginning on the 48 hour industrial challenge each group is given a problem statement and the groups
198 are given 3 hours to analyse the problem statement and come up with a hypothesis as well as points that need
199 to be further clarified. The groups are then taken to visit the industrial partner aligned with the real-world
200 problem. It is important to note that all industrial partners have restricted access facilities due to risks of
201 contamination and confidentiality. However, the participants are allowed to tour these facilities after a safety
202 introduction. For many participants this will be the first time they have visited an industrial scale
203 biotechnological production process. The objective of the visits is for the participants to gain an intrinsic idea
204 of the size and scale of the problems they will face in implementing a new concept/change in a facility, and
205 take this into consideration when evaluating different scenarios for the generation of implementable and

206 practical solutions. The facility tour is followed by a detailed discussion on the challenge with the company
207 representatives. The company representatives are experienced scientists and engineers, who impart practical
208 knowledge to participants that help them in arriving at a practical solution. Following the visit to the
209 industrial production facilities, the groups have roughly 36 hours left develop a best fit solution, taking into
210 account all relevant considerations.

211 During the 48 hour industrial challenge, the candidates have to think out of the box and try to combine fine-
212 tuned scientific solutions with practical industrial considerations such as cost benefit analysis, regulatory
213 approvals, integration into existing production runs and plant layouts which contribute substantially to the
214 decision making process. The challenge truly enriches the learning experience as participants within a group
215 are from a multitude of backgrounds. The group discussion not only allows the application of specific
216 scientific knowledge, but also allows for collaboration among disciplines. While initially some groups are
217 challenged by this, most groups eventually manage to work out how to efficiently work as a team. The 48
218 hour industrial challenge is an excellent example of a team based learning opportunity, which is an area of
219 active interest in chemical engineering education [8].

220 5.3 Learning outcome

221 At the end of the 48 hours, the participants are expected to present a short report documenting their findings
222 as well as to provide a short presentation. The past solutions proposed to the 48 hours industrial challenge
223 problems have generally been well received by the industrial partner companies. In some instances, these
224 solutions have led to further detailed investigations into the topic and to the implementation of the suggested
225 solutions. These success stories show that it's not only the participants who benefit from the case studies, but
226 also the companies. As a result of the positive results gained during the 48 hours challenge, the industrial
227 partners are continually encouraged to actively participate in this activity.

228 6 Student Experience

229 The feedback from the participants reflects that the lectures, company visits, and the 48 hours challenge are
230 productive in terms of being state of the art, applied and industrially relevant. The social activities helped in

231 team building and networking. This can be gauged from the responses and questionnaire answers from
232 former participants:

233 *“It was one of the best experiences in a work environment for me. With well-planned lectures interspersed*
234 *with social activities, it was a balanced one week. Rigorous and relaxing at the same time. Team building*
235 *activities were fun and company visits were educating. It's always nice to meet peers from other universities.*
236 *Biopro WTC gave me new friends who I learnt from and will cherish the one week in beautiful Sorø”* states
237 Sumana Narayana, a PhD student at University of Copenhagen, Denmark who attended WTC in 2017. The
238 program promotes the motto of ‘work hard, play hard’ wherein several social activities are organized for the
239 participants allowing them to interact with each other and aiding in the teambuilding. The balance described
240 by Sumana finds common ground with the other participants, as evident from Figure 3a where 78 % of all
241 WTC participants strongly agree with this observation, while another 20% agree. *“Biopro WTC was an*
242 *extremely well organised course that started with mellow introduction in Copenhagen, continued with*
243 *science camp in Sorø, peaked and intensified with the course project, and rounded off again in Copenhagen.*
244 *The course was centred on biotechnology manufacturing and problems associated with large scale*
245 *production. The lectures provide valuable material and insight into the subject, company presentations*
246 *showed challenges the industry is facing and the course project allowed participants to provide their*
247 *solutions for relevant problems”* states Andres Maser, PhD student at the Center of Food and Fermentation
248 Technologies in Talinn (Estonia) who attended in 2017.

249 The majority of the participants (96%) would highly recommend this course to fellow students as evident
250 from Figure 3a. In the past few years this was seen by the application of students who had heard from the
251 course from previous participants and came with high expectations. As evident from Mathew Proctors, who
252 comments *“Attending BIOPRO WTC improved my understanding of process analytical technology and,*
253 *more generally, biotechnology, which has proven invaluable in my career. I also really enjoyed having the*
254 *opportunity to network with world-leading experts and like-minded PhD students from all around the*
255 *world.”* Mathew attended the second edition in 2014, representing the University of Auckland, New
256 Zealand. After completing his PhD, Mathew now works for a large dairy company in New Zealand.

257 One of the students that was referred to the course by a colleague is Noelia Gudino, PDEng student at the
258 Technical University of Delft, the Netherlands, who attended in 2017: *“When looking for interesting courses
259 to obtain a PDEng degree, a PhD colleague recommended me to apply for the BIOPRO course. She
260 especially highlighted its industrial relevance. Indeed, I got to know several Danish companies, not only
261 concerning their general activities but also about detailed technical aspects of their operations which I find
262 very interesting. Additionally, I had the opportunity to significantly expand my professional network by
263 meeting PhD candidates from all over the world involved in all aspects of biotechnology/bioprocess
264 research. I found the BIOPRO course an amazing and unique opportunity to not only expand my technical
265 knowledge but also to build new and valuable working relationships.”* While the course is just a week long,
266 most feel that they have gotten a good orientation on full-scale processes, as for many it was the first time
267 working on this scale. Due to the high diversity of participants in the course, it can be a challenge to tailor
268 the lectures to the needs of those following it. As illustrated in Figure 3c, 63% of the participants strongly
269 agree that they have gotten good theoretical knowledge of methods and challenges in full-scale bioprocess
270 monitoring and optimization, while 32% agree within this statement. As such 95% of the students share a
271 positive opinion on the theoretical content of the course.

272 As most of the participants are in different stages of their doctoral/master studies, WTC enables them to get
273 an industry's perspective that is quite different from an academic one with respect to large-scale
274 manufacturing. This included concepts such as process safety, which is much better illustrated and
275 understood in an industrial setting [9]. The participants through the interactive group work also have an
276 opportunity to improve their interpersonal and transferable skills which are increasingly become more
277 important in chemical engineering education [10]. The lectures give a detailed insight into the scientific
278 advancements made in the area of biotech manufacturing, namely bioprocess monitoring and control.
279 Participants are given the opportunity to learn and network with representatives from the leading biotech
280 companies as well as Universities, resulting in excellent exposure not only to the technical expertise and
281 biotech manufacturing process they have to offer, but also to the hospitality and work culture that exists in
282 Denmark. This networking is further promoted by the gala dinner organised at the Carlsberg Foundation

283 which allows for a relaxed night of discussing the potential biotechnology advances that result from
284 academia-industry collaboration. In the 2017 WTC, the attendees to the gala dinner also had the rare
285 opportunity to tour the Carlsberg lab, which has been the birthplace of many innovations in fermentation
286 technologies in the past century. All in all, the course puts Denmark on the map for academically educated
287 talents from around the world. After the course, 73 % of the participants have responded that they see
288 Denmark as a highly attractive environment to work in the biotech industry as evident from Figure 3d, while
289 22% also consider it as a good environment to pursue a further career.

290
291 **Figure 3:** Results of highlighted responses to the questionnaire given to the participants after the course. The results are combined
292 from the years 2013-2017 (120 participants).
293

294 **6.1 Industry Feedback on 48 Hour Challenge**

295 The industrial feedback to the solution proposed by teams at the 48 hour industrial challenge has also been
296 overwhelmingly positive. This feedback has been made by the senior representatives of the industrial
297 partners at BIOPRO consortium director board and steering committee meetings. For example one
298 representative that has been involved with the 48 hour industrial challenge over the years remarked

299 In an industrial environment it is very difficult to get 48 hrs continuously to work on an issue. Getting the
300 BIOPRO world talent team of 5 students is actually a perfect way to investigate on some of our challenges
301 for which we do not have enough time, but are still very important to know why it happens. In 2015, 2016
302 and 2017 we have given industrial problems to the WTC participants, and they have suggested us solutions
303 which are actually very relevant and useful to fix (these) issues. They put their heart out for these
304 assignments and give their best to come up with logical solutions, as they might be getting a chance to come
305 and work for us eventually. Though we are very busy in our daily production tasks it is completely worth
306 spending time on these students and assignments as it is in our own interest as well.

307 This sentiment of mutually beneficial outcomes are shared by all the industrial partners involved, as over the
308 last five years they have continued to dedicate their valuable time to represent their companies at the WTC
309 lectures, as well as opening up their facilities and further allocating multiple specialists time during the 48
310 hour industrial challenge. It is also important to note that many of the solutions suggested over the years by
311 the students have resulted in further studies and development, which in some instances has resulted in
312 industrial implementation.

313 **7 Extending Outreach**

314

315 Although WTC has proved itself as an excellent opportunity for post-graduates to get relevant practical
316 knowledge, network, and search for practical solutions to real problems faced by the bioprocess industry, the
317 number of participants who can attend is limited by the funding and physical size constraints. As such, an

318 important number of young talents who apply for the course have to be turned down, which can be
319 considered a loss of opportunity.

320 One way to overcome the limitation of the number of participants, without affecting the high quality of the
321 course is through the creation of virtual labs [11] and even virtual classrooms [12], such as the online
322 certificated courses offered by prestigious universities, as well as virtual challenges, like hackathons. These
323 pedagogical methods enhanced by technology would allow the WTC concept to expand, without significant
324 ongoing financial commitment by the creation of an on-line exploratory platform to provide a close
325 experience in a large-scale plant, and with the possibility to connect people from different backgrounds. An
326 option to create an accurate representation is the implementation of the learning process on and around
327 spherical imagery of real operating plants, coupled with interactive embedded activities and content [13].
328 Although the use of virtual reality is a promising area in education and training, it is still in development,
329 with the improvement of the models used for the simulation or the technology required. Moreover, the
330 possibility to provide participants with an industrial experience through a virtual classroom has been
331 implemented in several companies such as Dow Chemical with its programs of "Interviewing Training" or
332 "Respect and Responsibility". The use of e-learning has been considered as a cost-saving measure, as it
333 avoids travel and classroom costs as well as time off-the-job. In the example of Dow Chemical, it was
334 estimated that a saving of \$30 million was achieved in 2000 by the implementation of its e-learning web-
335 based system [14].

336 Although the use of virtual class room techniques has many important advantages, successful
337 implementation of the concept requires significant planning and effort. Even in an ideal environment, it is
338 not exempt from drawbacks. The most frequently mentioned drawback is the up-front cost, as it requires a
339 significant capital investment for design and implementation. On the other hand, the lack of interaction
340 among trainees can make the learning less attractive to the participants [15]. However, this can be potentially
341 reduced by using tools such as chats/interactive environments and/or the creation of introductory videos of
342 participants. One concept that can be explored to remedy this issue is concepts such as gamification and
343 active learning, which has been an area of interest in chemical engineering education [16].

344 Another critical issue is the management of intellectual property rights (IPR), as it is an environment based
345 on the close collaboration of several companies and universities. Therefore, a key difficulty in extending this
346 type of a course through e-learning would be the legal aspects of separating private and public content.
347 However, this can be overcome by proper knowledge and implementation of the intellectual property laws
348 and protection mechanisms, such as copyright, patents, and trademarks. In the case of a virtual platform, it
349 would be prudent for it to be protected by a copyright licence, where the copyright would provide control
350 over the reproduction, distribution, performance, display of the work and the preparation of derivative works
351 of all tangible media such as software [17]. It is also important to highlight that copyright does not protect an
352 idea, but only protects how ideas are expressed, and consequently will protect the participants and the
353 company privacy.

354 Therefore, it is the authors' opinion that a virtual learning platform, with careful planning, design, and
355 information technology infrastructure and change management, could provide the consortium the potential to
356 expand global presence of its course. One potential path to avoiding the confidentiality and IP issues is the
357 development of a benchmark bio-based production process, which has been a recent project that is underway
358 at the Process and Systems Engineering group at DTU in conjunction with the BIOPRO consortium. The
359 idea in this project is to develop a single benchmark simulation that captures all key features of bio-based
360 production processes that are present in BIOPRO consortium companies, which can be used for education
361 and testing purposes. Furthermore, the use of the new technologies, like virtual reality, leap motion, or
362 immediate chat communication allows the creation of a global, accessible virtual class for the teaching of
363 bioprocesses at an industrial scale level available to interested participants.

364 **8 Conclusions**

365 The lack of an advanced course in the area of bio-based production and the inherent multidisciplinary nature
366 makes BIOPRO WTC a unique course. The WTC provides the participants with the opportunity to get a
367 focused yet thorough overview of industrial bio-based production processes, while allowing them to apply
368 the skills they have learnt during the course and previously on real world industrial problems. The student
369 survey conducted as a part of the study illustrates that the overwhelming success of WTC is successfully

370 imparting technical and industrial knowledge to participants, while also providing a good balance between
371 social and academic activities. WTC has also created a pool of alumni in the area of bio-based production
372 with active ongoing collaborations. However, in the current format, WTC cannot accommodate a high
373 number of participants; new technologies are being explored and this can pave the way to increase its future
374 impact and outreach.

375 Acknowledgements

376 The authors would like to acknowledge the Novo Nordisk Foundation who provides complete financial
377 support to conduct BIOPRO WTC. Furthermore, support from Innovation Fund Denmark through the
378 BIOPRO2 strategic research centre (Grant number 4105-00020B) is also acknowledged. The authors would
379 also like to acknowledge the Carlsberg foundation (Grant Number CF17-0403).
