Brændstoffer og energiforbrug i fremtidens transport

By Jesper Schramm

- **Transportformer**
 - Vejtransport
 - Tog
 - Skibe
 - Fly

• **Fremtidens teknologi til vejtransport**

- Forbrændingsmotorer
 - Benzin, diesel
 - Naturgas
 - GTL, CTL, BTL
 - Biobrændstoffer
- Brændselsceller
- Elektriske biler

Background assumptions for the different IEA transport scenarios.

ETP Transport Scenarios

- Baseline - business as usual through 2050
- ACT - measures costing up to \$50/tonne; stabilization of CO₂
 - Efficiency measures dominate
- BLUE - measures costing up to \$200-500; reduction of global CO₂ to below 2005 levels with downward trend
 - BLUE Map - mix of biofuels, fuel cell vehicles (FCVs), and electric vehicles (EVs) for cars and light trucks in 2050
 - BLUE Conservative - no FCVs or EVs (only plug-ins)
 - BLUE FCV Success - FCVs dominate by 2050
 - BLUE EV Success - EVs dominate by 2050

Worldwide CO₂ emissions in 2050 according to the various IEA transport scenarios.

ETP Transport GHG Emissions (well-to-wheels CO₂-equivalent emissions)

Figure 27

Well-to-wheel (WTW) energy efficiency and associated CO₂ emissions from different fossil and renewable fuels. [49]

Figure 24

Comparative data for the VW Golf diesel from 1976 and 2011 [45].

VW Golf VI diesel 2011

VW Golf diesel 1978

Displacement (l)	1.6	1.5
Max output (kW)	77	37
Torque (Nm)	250	84
Max speed (km/h)	190	144
Acceleration 0-100 km/h (s)	11.3	18
Kerb weight	1318	780
Fuel consumption (EU comb. l/100 km)	3.8	6.4
CO ₂ emission (g/km)	99	163
Particulate filter	yes	no

Forbruger behov og prioritering

VW Golf I diesel 1976

VW Golf VI diesel 2009

15,5 → 21 km/l

engine displacement (l)
power (kW)
torque (Nm)
speed (km/h)
acceleration 0 –
curb weight
fuel consumption
CO₂ emission (g)
particulate filter

30 km/hour!

"Smooth Traffic"!

- +++++Sustainability

**Everything has to fit together
– different stakeholders have to work together!**

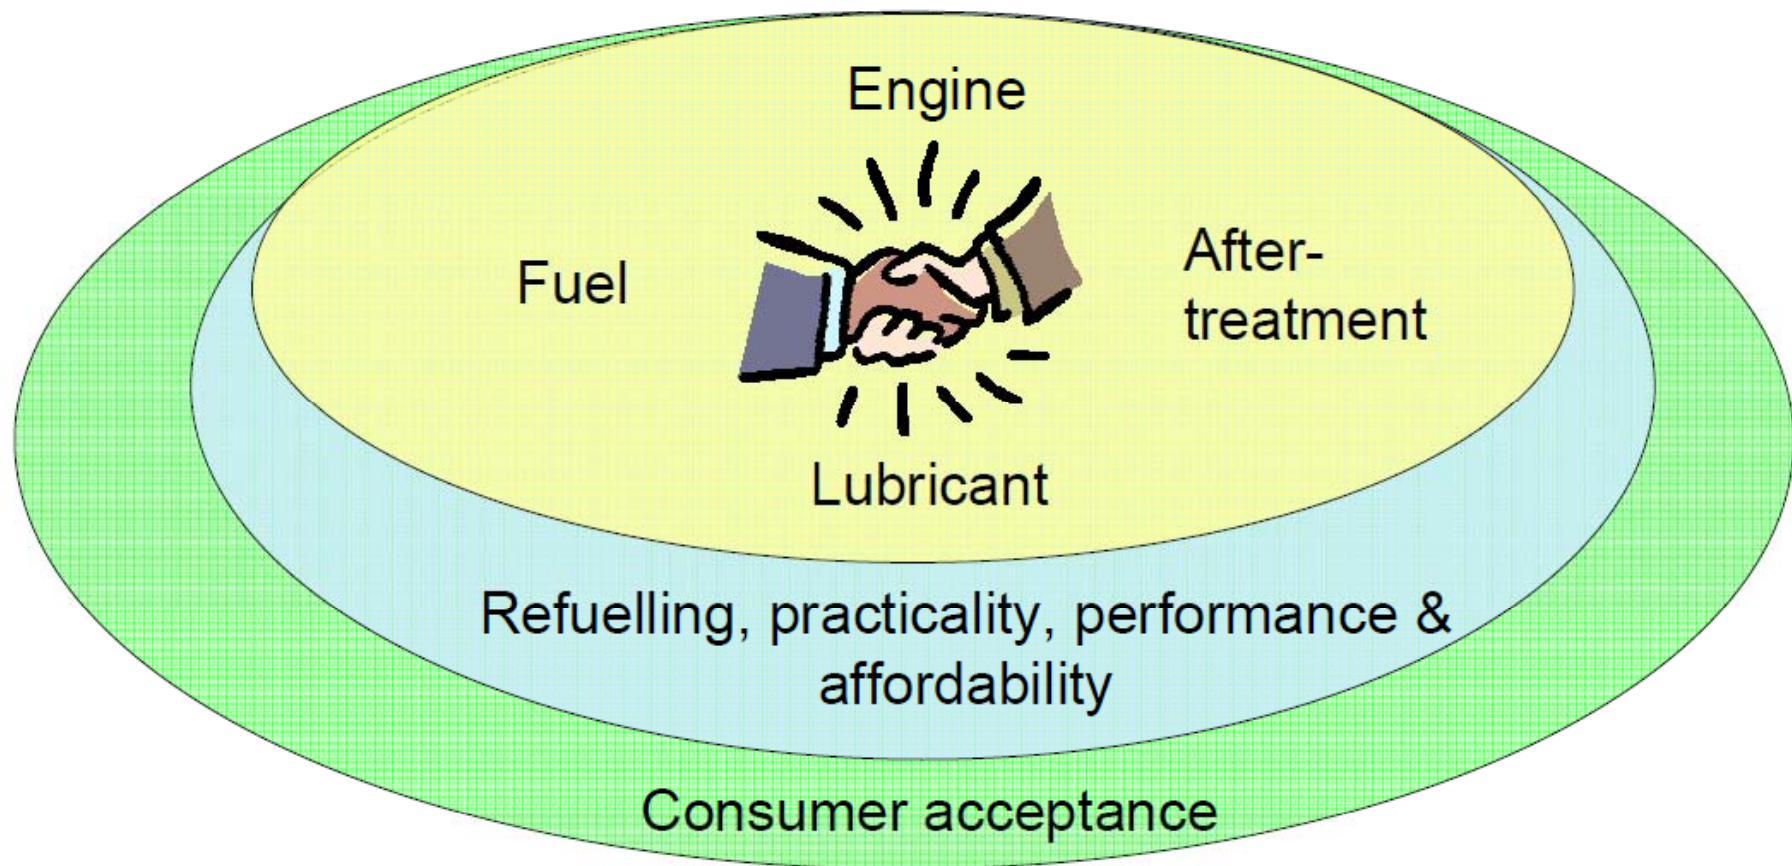

Figure 28

Comparison of fuel economy (km/l petrol equivalent) for vehicles using various technologies, 2009. The performance of European cars appears somewhat higher than their US counterparts due to differences in the test procedures and car models [52].

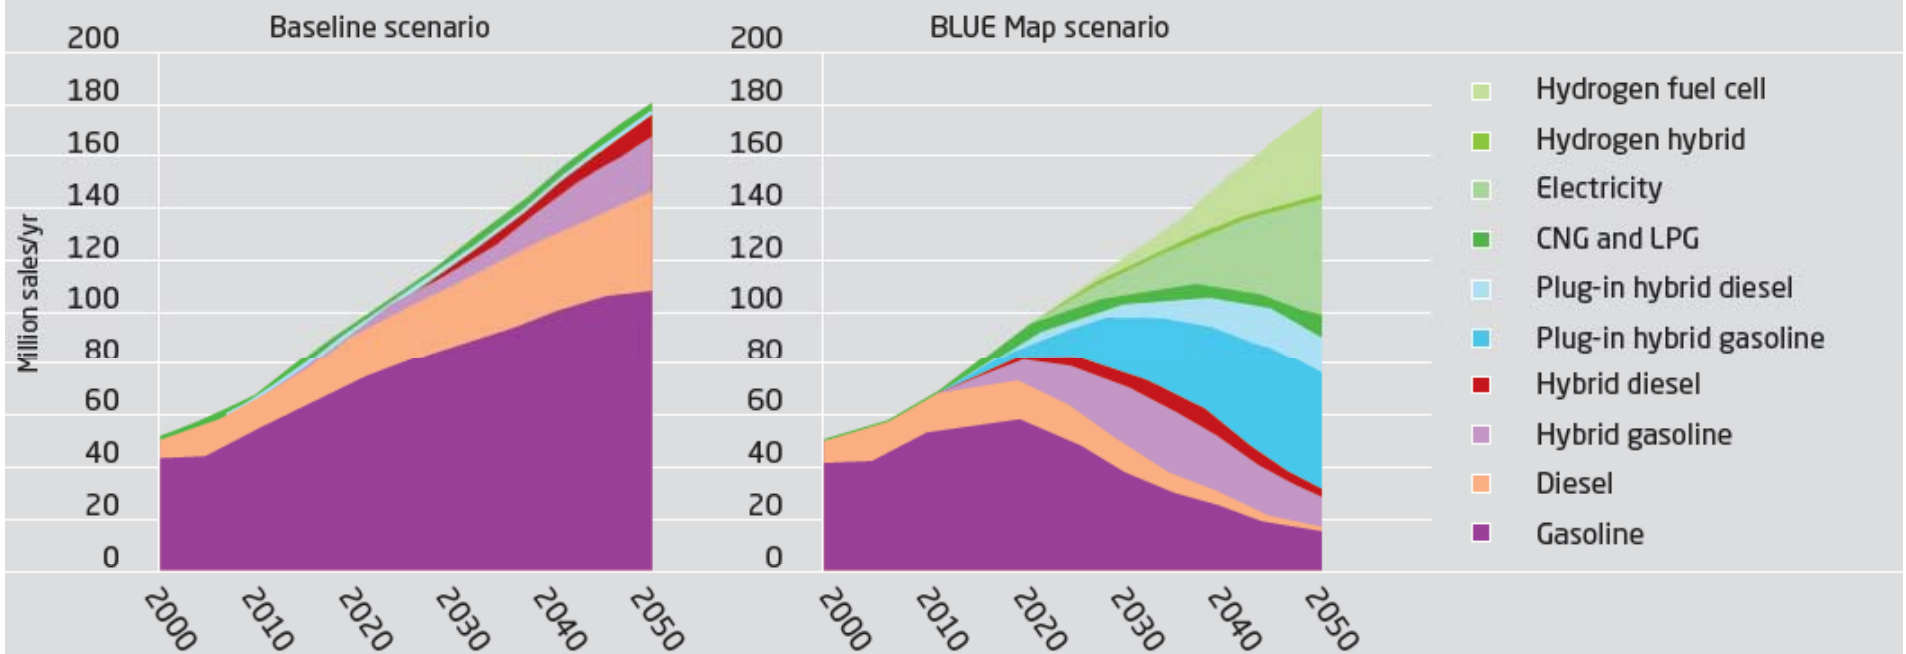

Figure 31

Yearly sales of different vehicle technologies as predicted by the IEA baseline and BLUE Map scenarios.

Danmark

Energipolitiske milepæle frem mod 2050

- **2020:** Halvdelen af det traditionelle elforbrug er dækket af vind
 - VE-andel i transport øges til 10 pct.
 - CO₂-udledning fra ikke kvoteomfattede sektorer reduceres med 20 pct. i forhold til 2005
- **2030:** Kul udfases fra de danske kraftværker, oliefyr udfases
- **2035:** El- og varmeforsyningen dækkes af vedvarende energi
- **2050:** Hele energiforsyningen – el, varme, industri og transport – dækkes af vedvarende energi.

Energistyrelsen:

	Vej		Bane	Luftfart	søfart
	<u>Personbiler/varebiler:</u>	<u>Lastbiler</u>			
Kort sigt	Diesel/biodiesel Benzin/bioethanol El	Diesel/biodiesel CNG (evt. hybrid)	El Diesel/ Biodiesel (Hybrider)	Jetfuel Flydende biobrændstoffer	Diesel Flydende biobrændstoffer CNG / LNG
Mellem- langt sig	Flydende bio- brændstoffer (benzin/diesel) El og brint Biogas Hybridteknologier	Diesel/bio-diesel Biogas/CNG/LNG Brint	El Hybrider (diesel/el/ biodiesel)	Flydende biobrændstoffer	Flydende biobrændstoffer Biogas
Langt sig	El og brint Biogas (Biobrændstoffer) (Hybridteknologi)	Flydende bio- brændstoffer - 2.g. El og brint Biogas	El	Flydende biobrændstoffer 2.g.	Flydende biobrændstoffer 2.g. Biogas

Konventionelle brændstoffer til transport i 2050:

- DK energiaftale 2012: 0%
- World Energy Council forecast: 80%

Danske ambitioner er banebrydende!

Conclusions:

- Motor fuels have been based almost entirely on crude oil for the last century
- During the last couple of decades engines built for traditional fuels have become more advanced and efficient; this has reduced fuel consumption by around 40%
- Natural gas is also becoming an interesting fuel due to its large resources worldwide
- GTL, CTL and BTL are liquid fuels produced from solid or gaseous sources
 - GTL and CTL are not very CO₂ friendly, but easy to implement
 - Methanol and DME produced from biomass are among the most CO₂-reducing fuels
- FCV progress is heavily dependent on an infrastructure
- With an acceptable fast charging infrastructure at least 85% of the one-car families in Denmark could be potential EV customers
- Range improvements resulting from better batteries are expected to create a large increase in the number of EVs in Denmark between 2020 and 2030
- PHEV's will be an important step in the transition to future EV's
- The future transport will be driven by dramatic efficiency improvements in modes of transport based on fossil fuels. At the same time it is necessary to promote research and demonstration of new power train technologies which can be used beyond 2050
- The Danish ambitions for 2050 are exceptional and challenging

Thank you for your attention!
