Added value: An improved modeling of China's regional energy characteristics and its global impacts in TIAM

- China is at the centre of an unprecedented shift in the global economy and the global energy industry. Over the past decades China has experienced fast economic growth, accompanied by rapid urbanization, increasing energy consumption, widening regional disparities and soaring green house gas emissions.
- This remarkable growth has led to twin challenges for China: (i) improving environmental sustainability and regional economic development and (ii) enhancing energy security.
- Any major effort to minimize, mitigate and adapt to the adverse effects of climate change will need to better understand and integrate China's future energy system pathways and related policy targets.

Using TIAM to represent key characteristics of China's regional energy systems – Defining East, Central and West China in TIAM

- The suggested sub-regional definition of China in TIAM is based on the PRC's Seventh Five-Year Plan (1986–1990), which grouped all provincial level divisions of China into three economic zones in order to promote medium to long term economic specialization and division of labour.
 - → 18 Region global model version of TIAM, based on 15 Region global TIAM 2011 version
- China East Region: export-oriented industries, including steel, chemicals, engineering and textiles; in 2010 about 578 million inhabitants (44% of Chinese population) lived on 13% of China's land area; currently the economic powerhouse, accounting for more than 92% of China's exports and about 97% of China's GDP in 2010
- China Central Region: most of China's coal and metallurgical industries, as well as agricultural production; in 2010 about 440 million inhabitants (34% of Chinese population) lived on 29% of China's land area; crucial for supplying energy to the provinces in China's East Region.
- China West Region: the least developed region; marginal share of about 1% in China's GDP in 2010; in 2010 about 293 million inhabitants (22% of Chinese population) lived on 57% of China's land area; major hydropower resources
