ENERGY, CLIMATE AND SUSTAINABLE DEVELOPMENT

Electric Vehicle Scenarios for India

Priyadarshi R Shukla Subash Dhar Kalyan Bhaskar

Development and Mitigation Forum 27 January2014 Cape Town, South Africa

Supported by:

Environment, Nature Conservation and Nuclear Safety

based on a decision of the Parliament of the Federal Republic of Germany

Presentation Agenda

1. Low Carbon National Transport Modeling Assessment

- Model System
- Scenarios Architecture
- 2. National Passenger Transport Demand
- 3. Sustainable Low Carbon Transport Scenario
 - Energy Demand
 - CO₂ Emission Mitigation
 - Air Quality Co-benefits
- 4. Electric Vehicle (EV) Scenarios
- 5. Conclusions

Soft-Linked Integrated Model System

Scenario Paradigm

Transport Scenarios Architecture

Sustainable Mobility Storyline

Non-Motorized Transport

Pipe Transport

National Passenger Transport Demand in Scenarios

Passenger Transport Demand

Modal Share of Passenger Transport

Sustainable Low Carbon Scenario **Modal Share**

Share in Road Passanger Transport

Sustainable Low Carbon Transport Scenario

Results from Modeling Assessment

Low Carbon Electricity Transition

Energy Mix for Transport

Transport Fuel Mix in 2050

Contribution to CO2 Mitigation in Sustainable Low Carbon Transport Scenario

CO2 Emissions- Transport

Air Quality Co-benefit

Electric Vehicle Scenarios

Electric Vehicles (EV) Scenarios

Future socio economic development along the conventional path: mirrors resource intensive path of developed countries Governments recognize multiple co-benefits of EVs (urban air quality; energy security etc.) and push their penetration

Global 2^oC climate stabilization target leads to high carbon price; this lowers carbon content of generated electricity

Scenarios Description: EV & EV_LCS

Electric Vehicle Scenario (EV): Assumptions

- Domestic policy supports: Direct capital subsidy, improved charging infrastructure, dedicated lanes, incentives for R&D in power train, batteries and smart grid technologies, quotas for EVs in urban public & goods transport
- Battery costs comes down to half of current costs in next 10-15 years: driven by advancements in battery technologies, improvements in battery capacities, declining component costs, and economies of scale in production
- Improved batteries with higher energy density will also help reduce weight of batteries: further pushing down EVs costs
- Limited range per charge put constraints on EVs penetration for urban transportation

Electric Vehicle plus 2^oC Scenario (EV_LCS): Assumptions

- Global 450 ppmv CO₂ equivalent concentration stabilization target
- Carbon Price rise: from US\$ 46/tonne CO2 in 2020 to US\$ 200/tonne CO2 in 2050 (based on outputs from IMAGE and MESSAGE models)

EV Share in Personal Motorised Transport

EV Share in Personal Motorised Transport

Share of EV for Public transport

(*) Excludes Demand for Passenger Transport met by Railways.

CO2 emissions: BAU, EV, EV_LCS

Conclusions

- Under global 2^oC stabilization policy, in 2050, India's:
 - Transport sector would mitigate 66% of BAU emissions
 - Transport Emissions will still be 60% above 2010 emissions
- The low carbon transition of transport sector is accompanied by sizable shift in fuels and technologies
- Low carbon transport transition shall deliver *Air Quality* and *Energy Security* co-benefits
- Electric Vehicles (EV) by themselves do not contribute to CO₂ mitigation; they may even increase emissions
- Under global 2^oC stabilization policy, in India, EV contribute sizable mitigation, nearly 38% to the BAU transport emissions in 2050
- Early penetration of EV in India would come through 2-wheelers; this would create infrastructures that would facilitate larger vehicles.

Thank You
