SCIENTIFIC OPINION

Scientific Opinion on the substantiation of a health claim related to vitamin D and contribution to the normal function of the immune system pursuant to Article 14 of Regulation (EC) No 1924/2006

EFSA Panel on Dietetic Products, Nutrition and Allergies (NDA)

European Food Safety Authority (EFSA), Parma, Italy

ABSTRACT

Following an application from VAB-nutrition, submitted for authorisation of a health claim pursuant to Article 14 of Regulation (EC) No 1924/2006 via the Competent Authority of France, the EFSA Panel on Dietetic Products, Nutrition and Allergies (NDA) was asked to deliver an opinion on the scientific substantiation of a health claim related to vitamin D and contribution to the normal function of the immune system. The Panel considers that vitamin D is sufficiently characterised. Contribution to the normal function of the immune system is a beneficial physiological effect for children. The Panel had previously assessed a claim on vitamin D and contribution to the normal function of the immune system with a favourable outcome. The target population was the general population. The Panel considered that vitamin D plays a regulatory role in the functioning of the immune system. The Panel considers that the role of vitamin D in the functioning of the immune system applies to all ages, including children. The Panel concludes that a cause and effect relationship has been established between the dietary intake of vitamin D and contribution to the normal function of the immune system. The following wording reflects the scientific evidence: “Vitamin D contributes to the normal function of the immune system”. The target population is children from 3 to 18 years of age.

**SUMMARY**

Following an application from VAB-nutrition, submitted for authorisation of a health claim pursuant to Article 14 of Regulation (EC) No 1924/2006 via the Competent Authority of France, the EFSA Panel on Dietetic Products, Nutrition and Allergies (NDA) was asked to deliver an opinion on the scientific substantiation of a health claim related to vitamin D and contribution to the normal function of the immune system.

The scope of the application was proposed to fall under a health claim referring to children’s development and health.

The food constituent that is the subject of the health claim is vitamin D, which is an essential nutrient and is measurable in foods by established methods. Vitamin D occurs naturally in foods and is authorised for addition to foods and for use in food supplements. The Panel considers that vitamin D is sufficiently characterised.

The claimed effect proposed by the applicant is that vitamin D “contributes to the normal function of the immune system”. The target population proposed by the applicant is children from 3 to 18 years of age. The Panel considers that contribution to the normal function of the immune system is a beneficial physiological effect for children.

The Panel had previously assessed a claim on vitamin D and contribution to the normal function of the immune system with a favourable outcome. The target population was the general population. The Panel considered that vitamin D plays a regulatory role in the functioning of the immune system. The Panel considers that the role of vitamin D in the functioning of the immune system applies to all ages, including children.

The Panel concludes that a cause and effect relationship has been established between the dietary intake of vitamin D and contribution to the normal function of the immune system.

The following wording reflects the scientific evidence: “Vitamin D contributes to the normal function of the immune system”.

In order to bear the claim, a food should be at least a source of vitamin D as per Annex to Regulation (EC) No 1924/2006. Such amounts can easily be consumed as part of a balanced diet. The target population is children from 3 to 18 years of age. Tolerable Upper Intake Levels have been established for vitamin D in this age group.

BACKGROUND

Regulation (EC) No 1924/2006 harmonises the provisions that relate to nutrition and health claims, and establishes rules governing the Community authorisation of health claims made on foods. As a rule, health claims are prohibited unless they comply with the general and specific requirements of this Regulation, are authorised in accordance with this Regulation, and are included in the lists of authorised claims provided for in Articles 13 and 14 thereof. In particular, Articles 14 to 17 of this Regulation lay down provisions for the authorisation and subsequent inclusion of reduction of disease risk claims and claims referring to children’s development and health in a Community list of permitted claims.

According to Article 15 of this Regulation, an application for authorisation shall be submitted by the applicant to the national competent authority of a Member State, which will make the application and any supplementary information supplied by the applicant available to the European Food Safety Authority (EFSA).

STEPS TAKEN BY EFSA

- The application was received on 19/11/2014.
- The scope of the application was proposed to fall under a health claim referring to children’s development and health.
- The scientific evaluation procedure started on 19/12/2014.
- During its meeting on 22/04/2015, the NDA Panel, having evaluated the data submitted, adopted an opinion on the scientific substantiation of a health claim related to vitamin D and contribution to the normal function of the immune system.

TERMS OF REFERENCE

EFSA is requested to evaluate the scientific data submitted by the applicant in accordance with Article 16 of Regulation (EC) No 1924/2006. On the basis of that evaluation, EFSA will issue an opinion on the scientific substantiation of a health claim related to: vitamin D and contribution to the normal function of the immune system.

EFSA DISCLAIMER

The present opinion does not constitute, and cannot be construed as, an authorisation for the marketing of vitamin D, a positive assessment of its safety, nor a decision on whether vitamin D is, or is not, classified as a foodstuff. It should be noted that such an assessment is not foreseen in the framework of Regulation (EC) No 1924/2006.

It should also be highlighted that the scope, the proposed wording of the claim, and the conditions of use as proposed by the applicant may be subject to changes, pending the outcome of the authorisation procedure foreseen in Article 17 of Regulation (EC) No 1924/2006.

---

INFORMATION PROVIDED BY THE APPLICANT

Applicant’s name and address
VAB-nutrition, 1 rue Claude Danziger, 63100 Clermont-Ferrand, France.

Food/constituent as stated by the applicant
According to the applicant, the food constituent for which the claim is made is vitamin D.

Health relationship as claimed by the applicant
According to the applicant, vitamin D contributes to the normal function of the immune system.

A number of mechanistic studies were provided which, according to the applicant, demonstrate that vitamin D plays a role in both innate and adaptive immune function and, as such, contributes to the normal function of the immune system.

Wording of the health claim as proposed by the applicant
The applicant has proposed the following wording for the health claim: “vitamin D contributes to the normal function of the immune system”.

Specific conditions of use as proposed by the applicant
According to the applicant, in order to bear the claim, a food should at least be a source of vitamin D as per Annex to Regulation (EC) No 1924/2006.

The target population proposed by the applicant is children from 3 to 18 years of age.

ASSESSMENT

1. Characterisation of the food/constituent
The food constituent that is the subject of the health claim is vitamin D, which is an essential nutrient and is measurable in foods by established methods.

---

The Panel considers that the food constituent, vitamin D, which is the subject of the health claim, is sufficiently characterised.

2. **Relevance of the claimed effect to human health**

The claimed effect proposed by the applicant is that vitamin D “contributes to the normal function of the immune system”. The target population proposed by the applicant is children from 3 to 18 years of age.

The Panel considers that contribution to the normal function of the immune system is a beneficial physiological effect for children.

3. **Scientific substantiation of the claimed effect**

The Panel has previously assessed a claim on vitamin D and contribution to the normal function of the immune system with a favourable outcome (EFSA NDA Panel, 2010). The target population was the general population.

The Panel considered that vitamin D plays a regulatory role in the functioning of the immune system (EFSA NDA Panel, 2010).

The Panel considers that the role of vitamin D in the functioning of the immune system applies to all ages, including children.

The Panel concludes that a cause and effect relationship has been established between the dietary intake of vitamin D and contribution to the normal function of the immune system.

4. **Panel’s comments on the proposed wording**

The Panel considers that the following wording reflects the scientific evidence: “Vitamin D contributes to the normal function of the immune system”.

5. **Conditions and restrictions of use**

The Panel considers that, in order to bear the claim, a food should be at least a source of vitamin D as per Annex to Regulation (EC) No 1924/2006. Such amounts can easily be consumed as part of a balanced diet. The target population is children from 3 to 18 years of age. Tolerable Upper Intake Levels (UL) have been established for vitamin D in this age group and have been set at 50 µg/day for children aged 1 to 10 years and 100 µg/day for adolescents aged 11 to 17 years (same as for adults) (EFSA NDA Panel, 2012).

**CONCLUSIONS**

On the basis of the data presented, the Panel concludes that:

- The food constituent, vitamin D, which is the subject of the health claim, is sufficiently characterised.
- The claimed effect proposed by the applicant is that vitamin D “contributes to the normal function of the immune system”. The target population proposed by the applicant is children
Vitamin D and normal function of the immune system

from 3 to 18 years of age. Contribution to the normal function of the immune system is a beneficial physiological effect for children.

- A cause and effect relationship has been established between the dietary intake of vitamin D and contribution to the normal function of the immune system.
