Implementation of preventive interventions – what are the contextual co-players and opponents?

Statement of the problem
Preventive interventions aims at improving the psychosocial work environment within organizations. The nature of preventive interventions are therefore that it affects the context in which it is implemented. We will claim that the context also affects the implementation of the intervention.

When the context affects the intervention the current approach is to consider to which extent the intervention program was followed (implementation fidelity, (Carroll et al., 2007)). Implementation fidelity implies two underlying logics, one that intervention models always are applicable, and two that the model is implemented in a static organization (Gish, Poulsen, & Ipsen, 2014; K. Nielsen, 2013). Implementation fidelity does not explain which organizational and managerial circumstances that affected the intervention positively or negatively. Thus, we find studies that show intervention models work, but the studies cannot explain why the intervention models work. Realistic evaluation has been suggested as an approach to gain information about which circumstances have affected who, and under which conditions (Hasle, Kvorning, Rasmussen, Smith, & Flyvholm, 2012; K. Nielsen, Abildgaard, & Daniels, 2014; Starheim, 2014).

When investigating the effects of interventions, it remains unclear which conditions have influenced the implementation process. The initial conditions suggested as important for the implementation process is among others management support (Cox et al., 2000; Kompier, Geurts, Grundemann, Vink, & Smulders, 1998). Others have also pointed to the importance of employee involvement (Lamontagne, Keegel, Louie, Ostry, & Landsbergis, 2007; Karina Nielsen, Randall, Holten, & Gonzalez, 2010). However, the studies do not explain the causal relation behind. Qualitative studies find that the term management support is too broad a term, because support from both top management and the first line manager is crucial for the implementation process (Ipsen, Gish, & Poulsen, 2014; K. Nielsen, 2013).

The general recommendation about employee involvement in interventions is criticized because it is not specified whether the involvement should be of all employees during the entire process, or it should just be involvement of few employees in one intervention step. (K. Nielsen, 2013).

Generally, we know much about the criteria for initiating an intervention, but we need more knowledge about how implementation actually happens. This paper investigates the promoting and inhibiting factors when implementing a preventive intervention.

The majority of studies investigating promoting and inhibiting factors in relation to implementation success primarily focus on the promoting factors. Inhibiting factors are lack of time for the intervention, change history in the organization, and that the intervention goals are not linked to the company’s KPIs (Ipsen et al., 2014). Some of the promoting factors will inevitably be inhibiting when they are absent, but we do not know how lack of management support manifest itself.

Procedures
In Denmark the worksites within hospitals is managed by five regions. The Capital Region of Denmark employs 36000 people, who primarily work within healthcare. The worksites are primarily hospitals, but there are also residential accommodation and pharmacies.
All capital worksites fill out an employee satisfaction survey every third year. When the results from the
survey is announced, the worksites should identify target areas and hereafter initiatives to the target areas.
We have identified the worksites where there has been a positive development in the psychosocial work
environment from the employee satisfaction survey in 2011 to the survey in 2014.
We choose four worksites, where we do interviews with the managers and facilitate a chronicle workshop
(Limborg & Hvenegaard, 2011; Poulsen, Ipsen, & Gish, 2014) with employees. The interviews seeks to
investigate which initiatives was launched as a reaction to the employee satisfaction survey in 2011, and
the chronicle workshop investigates whether the initiatives was actually implemented in the daily work
routines, and whether other circumstances could have influenced the employee satisfaction survey in 2014.

Analysis
Datacollection is currently ongoing.
The interviews and the chronicle workshop will be transcribed before the data is analyzed. The analysis will
initially consider promoting and inhibiting factors in relation to implementation of initiatives at the
worksites. The initial analysis will guide the in-depth analysis afterwards.

Results
Results are not available yet.

Practical Implications
We intend to develop an implementation tool, which supports managers and employees in the
implementation process.

Conclusion
Conclusion is not available yet.

of a work community and understand its culture. In *Facilitating Change - Using interactive methods in organizations, communities and networks* (pp. 305–325).

Summary (3-4 sentences):
Preventive interventions aims at improving the psychosocial work environment within organizations. When investigating the effects of interventions, it remains unclear which conditions have influenced the implementation process, and which effect the conditions had on the implementation process. We investigate the contextual factors in an implementation process related to an employee satisfaction survey, and investigate whether the factors have been inhibiting or promoting for the process.

Learning objectives (2-6):
After attending the presentation you should be able to:
- Identify contextual factors that affects an implementation process
- Describe how contextual factors affect implementation processes

Themes or questions adressed in presentation:
The presentation addresses the contextual factors in an implementation process, and whether they promote or inhibit the process.
