# Outline

- Offshore wind farms wakes and clusters
- Wind-wave coupled modelling
- Leading edge erosion
- Satellite Synthetic Aperture Radar (SAR) wind maps
- Coastal wind speed gradient influences power production
- Offshore wind ressource
- Conclusions

# Offshore wind farm wakes and clusters

# FUGA : Wake model for large offshore wind farms

## Windfarm wake view

- Solves a linearized CFD model: Mixing length,  $k-\varepsilon$  or 'simple' ( $v_t = \kappa U_* z$ )
- Mixed-spectral formulation
- Massive use of look-up-tables (LUTs) and preLUTs (used to make LUTs)
- Superposition of wakes
- No numerical diffusion
- No spurious mean pressure gradient
- 100000 times faster than CFD

# Wind wave coupled modelling

Xiaoli G. Larsén, Jana Fishereit, Patrick Volker, Marc Imberger, Andrea Hahmann, Poul Sørensen, Jake Badger, Matti Koivisto, Kaushik Das, Petr Maule, J. Du

## A fully-coupled modeling system for offshore applications that:

- 1) Takes into account of the dynamical relations between wind, wave, ocean and wind farm wakes (Fig. 1, Fig. 2)
- 2) Can be used for forecasting met-ocean conditions
- 3) Can be used for wind resource assessment with farm wake effect calculated
- 4) Can be used for offshore operation and maintenance
- 5) Can be used for obtaining design parameters, e.g. extreme wind and extreme wave (e.g. Fig. 3)

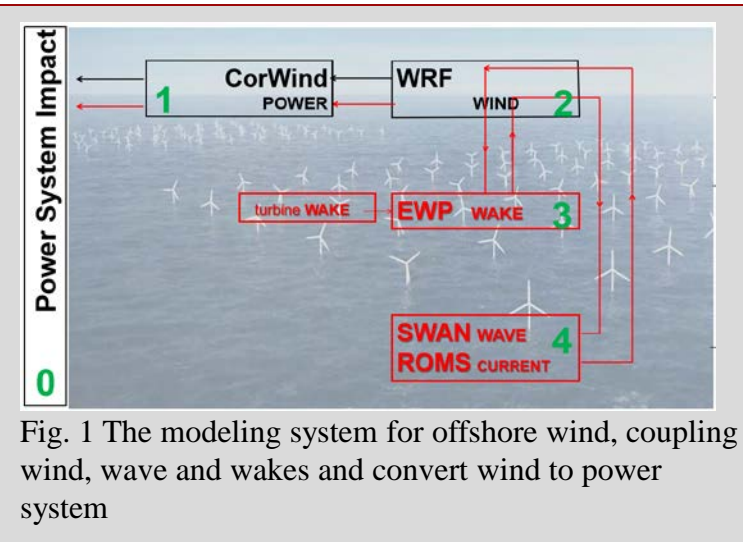

Fig. 1 The modeling system for offshore wind, coupling wind, wave and wakes and convert wind to power system

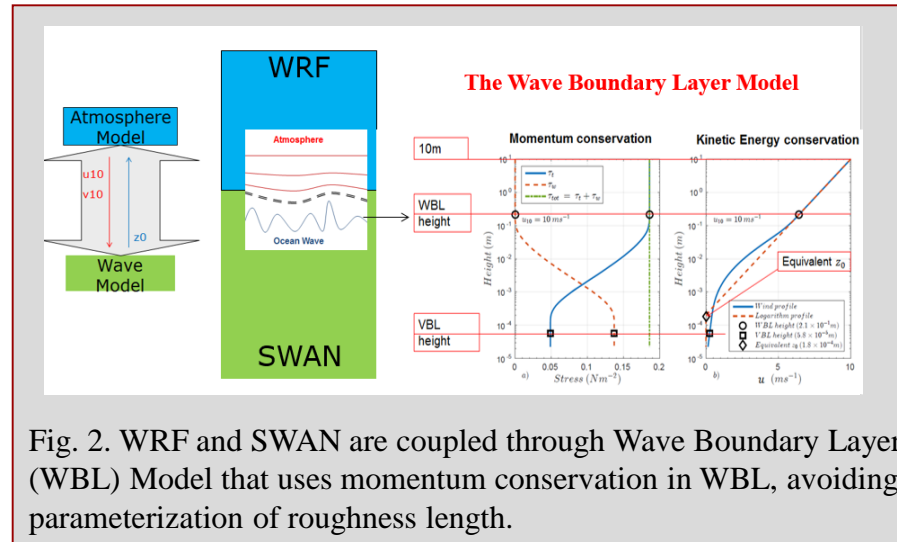

Fig. 2. WRF and SWAN are coupled through Wave Boundary Layer (WBL) Model that uses momentum conservation in WBL, avoiding parameterization of roughness length.

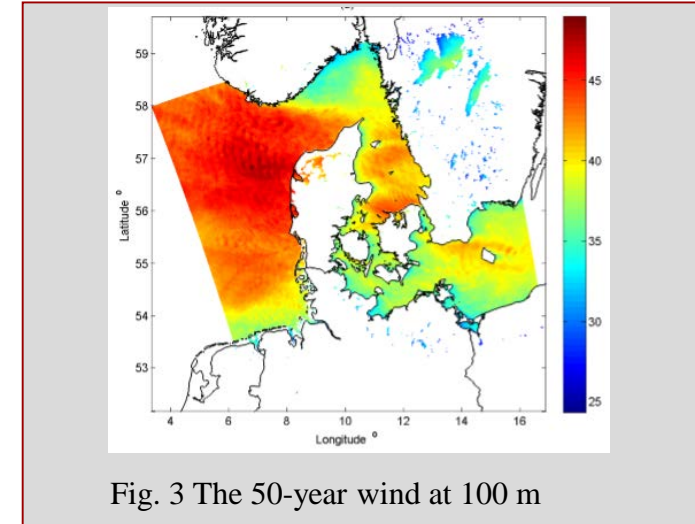

Fig. 3 The 50-year wind at 100 m

# Leading edge erosion

# EROSION

- 1. Research hypothesis:** Erosion damage is mainly generated during heavy precipitation (big drops of rain or hail), which occurs in a very little fraction of the turbines operation time. By reducing the tip speed of the blades in these few hours a significant extension of the leading edge lifetime can be obtained with negligible loss of production.
- 2. Methodology:** Define rain and hail erosion classes to quantify leading edge blade in-field and in lab testing. Correlations between rain intensity, droplet size, impact speed, materials properties, etc. will be established.
- 3. Measurement Device:** Low-cost prototype for precipitation measurement on site and real time warning device enabling modern control of wind turbines.
- 4. Erosion safe mode:** A safe mode control based on the erosion classes to control the wind turbine, reducing the tip speed under severe conditions – preventing aerodynamic degradation and reducing maintenance costs.

# Rain Erosion Tester

Example of specimen

Bech, Hasager and Bak 2018 Extending the life of wind turbine blade leading edges by reducing the tip speed during extreme precipitation events. *Wind Energy Science*, <https://doi.org/10.5194/wes-2017-62>

## Wöhler curves for droplet diameters of 1.5, 2.0 and 2.5 mm

Bech, Hasager and Bak 2018 Extending the life of wind turbine blade leading edges by reducing the tip speed during extreme precipitation events. *Wind Energy Science*, <https://doi.org/10.5194/wes-2017-62>

## Control strategies

Apart from a reference case where it is assumed that there is no erosion, six different control strategies are investigated based on the model for expected lifetime for the blade leading edge:

- Control strategy 1 with expected life time of 1.6 years
- Control strategy 2 with expected life time of 10.4 years
- Control strategy 3 with expected life time of 24.4 years
- Control strategy 4 with expected life time of 53.9 years
- Control strategy 5 with expected life time of 106.5 years
- Control strategy 6 with expected life time of infinite many years

Bech, Hasager and Bak 2018 Extending the life of wind turbine blade leading edges by reducing the tip speed during extreme precipitation events. *Wind Energy Science*, <https://doi.org/10.5194/wes-2017-62>

## Calculation of the life time of the blade leading edge with no reduction of the tip speed. Control strategy 1

| Rain intensity<br>[mm/hr] | Droplet size<br>[mm] | Percent of time<br>[%] | Hours pr year<br>[hrs/year] | Blade tip speed<br>[m/s] | Hours to failure<br>[hrs] | Fraction of life spent pr year<br>[%] |

# New European Wind Atlas

Map of tall offshore met-masts used for validation

# New European Wind Atlas

- First release at Wind Europe Conference in Bilbao 2-4 April 2019
- Final release at
- Wind Europe Technology Workshop: Resource assessment 2019

**27 – 28 June, Brussels, Belgium**

**The 5<sup>th</sup> edition of this technology workshop will focus on reducing uncertainty in wind farm resource assessment.**

# Conclusions

- Wind farm wakes within and between wind farms (clusters)
  - *Observe and model the wake effects (e.g. SAR data, WRF and FUGA)*
  - *Wind-wave coupled modelling to power production and extreme winds*
- Leading edge erosion caused by heavy rain
  - *Rain erosion at blades to be predicted (and avoided)*
- Coastal wind speed gradient influences power production
  - *Observe and model coastal wind speed gradients to predict production*
- Large archive on satellite wind maps for applied use
  - *Wind resource modeling and measurements are necessary to reduce uncertainty*
- **Recommendation: to study offshore meteorology wind and rain!**
