

Research is based at DTU Food in the research group Microbial Biotechnology and Biorefining. Focus is on the development and utilization of the in-house LAB strain collection containing more than 2000 isolates from different biological niches, that has been established at DTU Food. A general theme has been the interest in applications that have benefit for society as developing functional foods and food additives. Additionally, the strains have been put into play for plant-based dairy alternatives. This is done by development of starter cultures for plant-dairy alternatives. Furthermore, research has been done on making better use of side streams from the industry.
